Hi everyone. I have been busy for a while, but I can notice a growing
interest in cassette based software. I do not know if I can spend
some time working on my cassette stuff but it would be nice to have
some technical information about the various Turbo cassette formats.
In places where disk drives were just far to expensive, some folks
modified the cassette unit to increase the baud rate. It seems that
the Turbo universal did not even need a hardware modification.
These Turbo tapes would load at 2000 to 6000 baud, so I am told.
I am considering adding some support to the wav2cas program for these
formats, but in order to be able to work on it, I need to know some
things about how these tapes are written.
I am hoping some of the folks that designed this stuff can actually
tell me more about it. Or maybe someone that just happens to have
this information. Here are just a few of my questions:
It looks like some tapes have three different sound frequencies.
Are these tapes simple FSK tones? If so, what are the frequencies for
mark and space? Is the third sound frequency just a leader tone?
Apart from the short bootstrap loader, which has a standard format,
what is the format of the Turbo files? Is there a format? It might
be just a huge stream of bytes, without checksum. If there is some
sort of checksum, I would need to know how to compute it.
It looks to me that the bootstrap loader takes control when it is
loaded and it looks at the SKSTAT register, looking directly at the
serial in pin of the SIO port, and decoding data without the help of
Pokey. But I might be wrong. Does anyone have the (documented?)
source code to this bootstrap loader?
Some research seems to point towards this information:
Turbo leader tone 1378 Hz, FSK tones 1764 Hz and 3392 Hz.
Standard FSK is 5327 for mark and 3995 for space.
There seem to be several Turbo formats, so I do not know which Turbo
version this applies to. To reduce it all to one question, I want to
know everything there is to know about the Turbo formats.
Any and all help is appreciated.
Keep those XL's/XE's buzzing.
Ernest.

Both the ones I owned did. They were just 130XEs with only have the memory
present.

It's been a really long time since I used my 1010 (almost 20 years ago),
but back in the mid 80s I spent some time playing with turbo formats.

Either I got the original software from a friend, or maybe I got it
from a german computer magazine - can't remember (sorry, I can't
remember the name of the software - if it had one at all).

I analyzed the software and started tweaking it a bit to see how far
an unmodified 1010 could go.

The code was in fact quite simple: IIRC it tweaked the original
SIO routine of the Atari OS ROM to just use a higher baud rate when
sending/receiving cassette data. Maybe it also used different
frequencies for mark/space, but I can't remember that correctly.

The rest of the code (block size, checksum stuff etc.) was exactly
the same as in the original SIO routine.

I tried different (higher) baud rates, and also experimented with
larger block sizes (eg 1 or 2k instead of 128 bytes, or the whole
file in just one large block) - it all worked quite well. I started
converting a few games to this high speed format (prepended with
a small boot loader containing the high-speed code), but then
lost interest soon when I got my 1050.

In case you are trying to read a format similar to this one
(don't know details about the other formats), I'd recommend doing
a FFT analysis of the WAV file (to find out the mark/space
frequencies) and then guess the baudrate from looking at the
WAV file. Should be doable with a little bit of trial-and-error.

Sorry, it's not much information I can remember, but maybe some others
know a little bit more details about other formats.

so long,

Hias

OK, a new emulator.
I found the site has the source code.
But there was talk of a Windows version.
I guess Petr Stehlick (sp?) and Thomas have ironed
out the license problem.
Nobody commenting here. If there's a Windows
or DOS compile, I'd like to see it. All the talk about
this emulator leads me to believe it might have some
improvments.

Yep. BUT:

I think "D1:FILENAME.TXT" would rather be the same as "D1>SUB1>FILENAME.EXT"
after you've changed directories into D1>SUB1.
Or maybe that was "D:FILENAME.TXT"...

# 1605. Name this game: Australian Q*Bert-eque game

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-07 08:11:12 UTC
From: bill@newbreedsoftware.com
Message-ID: <AuY9a.71057$lk.3094158@typhoon.sonic.net>
Source record: 22818

There was this VERY cute Shareware or free game written in Australia
(I think my members of a user group) which had game play _kind_ of similar
to that of Q*Bert.

It's kind of an isometric view of the game area. You're a cute little
critter (with sunglasses, I think) and you jump around between hexagon-shaped
tiles. When you land on one, it gets pushed down (and a corresponding one
elsewhere on the screen moves up). The object is to get all of the tiles
at the same, middle level.

What's the name of this game!? I've completely forgotten, and I think I'm
too tired to use Google very well. ;^)

Thanks!

What about the idea of pluggable software modules for peripherals? A
module for an MIO, one for a MUX, one for an XEP, etc? I have an Apple II
java emulator that allows you to plug and unplug peripherals while it is
running. The peripherals are in seperate java modules. In MS C I suppose
they could communicate through COM? Just expose the API and let users
designe and compile their own peripheral modules. It would take some of
the load off of yourself. Just an idea to kick around. :-)

NACK. The datasheet mentions that you could use the intensity output
of the NS405 to switch between two colors (instead of halfbright/
fullbright). And then, the output would still only be at TTL level
(no PAL/NTSC color bursts...). Another point: the intensity attribute
is stored on a per-character basis. So the most you could get out
of the XEP80 is eg to switch between "white on black" and "blue on
black" characters. Connecting a TTL monitor (like CGA) would be
doable, but anything else (especially color PAL/NTSC composite
output) would really be a mess.

IMO this minor improvement would not be worth the effort.

> Data sheets are available at freetrade.com I heard.

They _were_ available at partiminer/freetradezone. I just checked
today and they are only available for paying subscribers (in other
words: lots of cash...) :-(

Isn't it an feature of the File Management System, not only a function of
the DUP? If it is in the FMS, I would vote for keeping it, because that
feature help writing compatible programs.

Example: Open #1,4,0,"D:>SUB>MYDATA.BTA"

would work in MyDOS and in Sparta DOS (please correct me if I'm wrong).
So killing this feature will need the programmers to make seperate programms
for MyDOS and SpartaDOS, if they would like to support Directries.

Why do you want to kill this feature? Do you need save some memory?
If this is the case, killing the ":" would be better. But that can break a
whole lot of existing programs.

Not an easy decision.

Best regards

Carsten

Great! I'm looking forward to see it!

Concerning the speach synthesis, I would have the manual of the SP0256AL2
chip, but the question is whether this was a widely used solution for the
Atari. I remember having seen some add-on box with software that contained
another speach processor, but I don't know its type as I've never seen
it myself.

Greetings,
Thomas

'Sadly a port to Plus looks far off unless some things change.'
Uhm. I get confused. I have atari800win Plus
3.1 for Windows (and XLIT .2). I guess you're talking
about the 'Plus' one I have. Except you say there is
a recent Antic update.
What's the latest a800winplus? a800dos? I think
those, and xlit are the only ones available and compiled.
The one by Thomas Richter is atari++, and only
source code is available and ready to be compiled
on a *nix/linux/bcd I guess.

# 1620. Re: Need information about Turbo cassette formats

There were two systems in Czech Republic:
First was Turbo 2000.
Newer one was Turbo Universal.

Both needed hardware mod of tape drive, usually XC12. Schematics are on
my site.

> It looks like some tapes have three different sound frequencies.

There are no frequencies ;-)

It's just a copy of Sinclair's format (I've been told that). You just
measure length of a pulse. Pulse consists of one change of serial input
pin. Turbo 2000 has 4 lengths:

super long - in the leader
super short - last pulse of the leader, it lets you know the polarity of
the pulses (if it's 0,1 or 1,0)
long - bit 1
short - bit 0

header has format:
byte $FF
byte type
byte[10] name
word begin_addr
word length
word run_addr
byte chksum

body
byte $00
byte[len] data
byte chksum

Chksum is xored byte of whole data including marker byte.

Turbo universal differences:
1) There are only 2 different lengths of pulse (they're equal for
leader/body)
2) Name is 20 bytes long
3) Marker bytes for header & body are different ($B7, $ED)

4) Speed is higher, loader computes it from the leader tone freq.

Loaders and copiers are on my site too.

There were different turbos in Germany & Poland. I don't know anything about them.

I wrote software for decoding the turbo format (bad, nonworking, abandoned) and software for creating turbo wavs from binaries (working, can send the sources).

Please reply to rdf0013@earthlink.net

Thanks,
James

Things I am looking for in trade:

LCD monitors
Gameboy advanced system
Neogeo Pocket system
Firewire HUB
USB cameras
X10 devices
portable mp3 players
Gemulator rom card

If you are interested please email me with a list of things you do
have for trade or if you would like to buy, just email me
and I will send you a list with what I am asking for the items.
If you have items for trade not listed above, please send list and we
may be able to work out something...

Things I have for sell or trade:

* Gateway solo 9300 specs: (has problems, might be easily fixed)
-PIII 600
-196mb ram
-10gb hard drive
-1024x768 active matrix screen 14.1"
-CD rom
-Floppy
-IR port
-Firewire port
-2 usb ports
-2 pc card slots
-ps/2 port for external mouse & keyboard
-digital spdif out
-composite video out
-Composite video in (for video capture or watching tv/movies)
+56k modem (pc card ï¿½ 3com w/xjack)
+10mb Xircom pc card nic w/adapter
+driver CD
+AC power adapter/chargers
+Windows98 with Eula preloaded.

* Atari arcade upright showcase cabinet (SN#152) with sub woofer, speakers, coin door and coin box. Can be made into a Mame cabinet or I have several arcade mother boards that can be mounted in it as well.
+For a Mame cabinet I will throw in the following items with the cabinet:( all working )
-Intel PIII 700
-Asus P3bf motherboard w/AGP
-128mb ram
-Sound Blaster PCI sound card
-Matrox MGA PCI video card (not the best, but its free with the deal)
-21" Viewsonic monitor
-8 way Joysticks
-Buttons and cherry switches (multi colors)
-Arcade power supply for lights
-Cable for wire harness
-PIII power supply
-32x max IDE CDrom drive

* Arcade Motherboards: (all worked when I pulled them from cabinets)
Star Castle
Vindicators (plus audio board)
Captain Commando / Knights of the Round (one motherboard and two daughter boards)
Time Soldiers ( with special controllers)
Super Street Fighter 2 (plus audio board)

* Sony Playstation with MOD chip, 1 controllers, 2 memory cards, gameshark pack, all cables and 95+ games and backups

* Nintendo64 system with controller, all cables, system memory expansion, 2 memory packs, controller carry case, 4 games

(Southpark, Super Mario64, Mortal Kombat Trilogy & Star Wars Shadows of the Empire)

* SNES system with Jap<>US adapter, all cables, 2 controllers, 4 games (Ranma 1/2 Jap rpg, Mechwarrior, Super Mario World & Ranma 1/2 hard battles)

* Panasonic 3DO development system (has switch on back to encrypt/decrypt, like MOD chip to play copied games) with 2 controllers, all cables, 20 Anime/Jap/US games (Shock Wave, Shanghai, Plumbers don't wear ties, Policenauts, Starblade, 3DO sampler, Night trap, Way of the Warrior, Strahl, Graduation, Belzerion, Powers Kingdom, Takeru,Virtual Puppet Reika, Nice Body, etc...)

* 2 Sega Genesis (new model & old model), Sega CD rom, 2 Controllers, Composite video cable, controller extension cable, 1 game (sonic the Hedgehog)

* 2 Sega gamegear, Sega Gamegear<>SMS adapter, Sega Link Cable, TV Tuner Module, Rechargable Battery Pack, Handy Gear case,

gamegear storage case, cartridge cleaning kit, Sega Master System
games (Trans Bot, Great Football, Space Gun, Heroes of the
Lance, Global Defense, Assault City, Hang On / Safari Hunt), Sega
Gamegear games (Chicago Syndicat, Beavis and Butthead,
Sports Trivia, Super Columns, Sonic the Hedgehog 2)

* Sega Nomad, AA battery module, 1 game (Shadow of the Beast)

* HP DAT 4gb scsi dat tape drive with Adaptec 2930 Ultra scsi card and
cable

* Zip 250 USB external drive

* Zip 250 IDE internal drive

* 2gb pc100 dimm memory (four 512mb dimms)

* 1gb pc100 dimm memory (four 256mb dimms)

* 128mb pc133 128mb dimm memory

* Protec bytelan 4way keyboard/video/mouse switch box, includes power
supply, doesn't come with cables

* Brother model 7150c 6-in-1 MFC color printer/fax/copier/scanner/vid
capture
See more details here:
http://www.superwarehouse.com/p.cfm?Brother_MFC_7150C&MFC7150C&p=119409

* Panasonic/Apple 2.6\5.2gb DVD-rom/DVD-ram IDE drive with four 2.6gb
(single sided) dvd ram cartridges (no drivers needed for
Windows XP, for other operating systems you will need to find drivers)

* Sound Blaster PCI sound card

* HP 10/100 PCI network card

* Teac 32max IDE CD-rom reader

* Mitsubishi IDE internal LS120 drive model MF357G-2111UAL

* NEC internal floppy drive

* HP C4459-56000 IDE CDR-W drive 8x/4x/32x 9100 series cdrw burner

* HP Vectra VL400 MT computer with 17" Hitachi Monitor and HP Laserjet
4l Laser printer
Windows 98se pre-installed with EULA
Intel Pentium III 933 mhz processor with 256 KB level-2 integrated
cache and 133 MHz front side bus
256 MB SDRAM memory at 133 MHz, expandable to 512 MB maximum
40gb Hard Disk
HP IDE CDrw 9100 (with Roxio Easy CD Creator 5 basic)
Floppy Disk
Win TV/Cast PCI (for watching TV/Cable on monitor)
Onboard Video Intel 815 integrated graphics Direct AGP

Onboard Networking: 10/100 Ethernet
Onboard Audio: 16-bit stereo full duplex integrated sound
-20-bit stereo audio recording and playback
-Full-duplex audio
-AC '97 architecture
Chassis
-Two 5 1/4 drive trays
-Two 3 1/2 drive trays
-Three free PCI slots
-One AGP
Built-in i/o:
- One 25-pin parallel port
- Two 9-pin serial ports (16550 UART)
- Two PS/2 connectors for keyboard and mouse (Mini-DIN)
- Two stacked Universal Serial Bus (USB)
- One 15-pin VGA connector on system board.
- Audio ports (stereo-in, stereo-out, microphone-in)
- One RJ-45 Ethernet port (10/100Base-T)
+Multimedia keyboard
+Mouse

* Apple Newton message pad with box of software (business and games),
Windows connection kit, 2mb memory card, newton serial
keyboard

* Atari ST Computer Hardware and software:
Atari ST Sams Manual
1040 STE, 1mb ram, 720k floppy, TOS 1.06
1040 STF, 1mb ram, 720k floppy, (missing TOS Roms)
Mega STE, 4mb ram, 720k floppy, TOS 2.04, ajax chip for 1.44 floppy
support, internal scsi hard drive, keyboard
2 Konica scsi 10mb 5 1/4 floppy drives, with box of 30+ disk
4 external 720k floppy drives
1.44 external floppy drive (modified ST floppy case)
4 mouse (atari and other brands)
Atari CX22 Trackball Controller (modified for ST)
Migraph hand scanner with cartridge
3 dma cables
ICD Link external scsi controller
SM124 Mono monitor
SC1224 JVC color monitor
Extra keyboard for ST
Xtra-RAM Deluxe kit for ST with 4mb ram (add 4mb to older ST models
easy)
Seagate ST32550N 2gb scsi hard drive
2 IBM OEM 4gb scsi drive model DCAS-34330

* Atari TT Hardware:
Atari TT back plate with serial 1 & 2 connectors and cables

* Atari 8bit Computer Hardware and Software:
Atari 800XL
Atari 1050 Disk Drive
Wico Bat Joystick
Wico Ball Joystick
Atari CX80 Trackball Controller (rare find, not many of these around)
All Power supplies included
Composite video cable
Super Breakout cartridge
Signalman Mark II 300 baud modem (rare item for collectors)
Joystick extension cable
Joystick Y adapter

* Atari 7800 Hardware and Software:
Atari 7800 Pro System
2 Mercury Joystick Controllers
Atari Paddle Cotroller
Atari Driving Controller
Atari Keyboard Controller
Star Raiders cartridge w/Video Touch Pad
BallBlazer cartridge

* Atari 5200 Hardware and Software:
Atari 5200 Trackball
Atari 5200 Joystick
Jungle Hunt cartridge

* Anime / Jap software & Music:
Anime Hyperguide Volume 1 - Project A-KO
Tenchi Muyo screen saver
Bubblegum Crisis screen saver
Ranma 1/2 screen saver
Demon School video CD
L'elisir D'amore video CD
Urotsukidoji Legend of the Overfiend video CD
Graduation Game CD
RG Veda digital movie (gametek cinema)
Robotech digital movie (gametek cinema)
Ranma 1/2 music CD
SM Girls Saber Marionette J music CD
Maison Ikkoku best collection music CD
Graduation teach me please music CD
Cyber Formula GPX singles music CD (2 cd set)
Blackboard Jungle video CD
Ninja High School comix CD
Inner Brain title game CD

* Roller Blade brand rollerblades size 9-10, knee pads, elbo pads and
wrist guards

* NEC Multisync mt600 color projector 800x600 max resolution,
composite and rgb/vga inputs, with remote and cables. Has wear
on one side from removing and replacing to storage.

* Panasonic DVD-L50 portable DVD player (excellent condition, light
scratchs on case top) with all cables, remote and battery.
plays DVD, DVD-r, SVCD, VCD, CD Audio and switches to monitor to plug
vcr or game system in and play on screen with audio. Has
video in/out, audio in/out, svideo, headphone connector. For more
details see:
http://www.amazon.com/exec/obidos/tg/detail/-/B00000JFMK/tech-data/ref=e_de_a_smtpd//103-8
397279-1086253?v=glance&s=electronics&vi=tech-data

* Apex AD-1100W DVD Player (new in box) plays cd with *mpg files, cd
with *jpg files, cd with *mp3 files, DVD, DVD-r, SVCD,
VCD, Kodak Photo CD, Audio CD, CDR Audio, has region code and
macrovision removed to play video from other countries and
allows DVD playback on projectors and copying to vhs tape (Hot item,
this is the 1mb rom unit that can be reprogrammed and is
saught after everywhere by video lovers)

* Pioneer laser disc player model CLD-D503 plays Laser Disc, CD Audio,
CD+G. Both side play (no flipping disc, unit is sensetive to low
quality disc that create more vibration) with remote and 93 Laser Disc

Sound's like Andrew Davie's 'QB' to me. Used to live on my homepage for a couple of years.

He's done a brilliant 2600 version of it too.

Aaron

Yep, the ones you mention are the only available pre compiled ones.

Re Atari800win Plus, like a few on here I am a beta bloke for it and
happen to know (without going into detail) that a newer version with
the updated core could be a fair while to say the *least* so I started
the drive for a Windows version of Thomas's Atari++ which Slor
thankfully took up.

Being that it's early days for the port and it's only just restarted
after the public differences between the two sets emulator dev peeps
there's no date for any releases of the Win port.

I'm sure Slor will pass on whatever info relating to that as the time
comes, I certainly am *not* speaking on his behalf.

Hello All,

Just started a new eBay auction for 13 issues of Atari Classics magazine, including the first issue. I still have other various Atari items on eBay, which are due to end soon including the manual for the rare Victagraph system for the 1020 plotter, DOS3 manuals, PAL TV cable, 'Dice Poker' APX tape, along with some other items of interest. The link is below (this will split on to two lines, so please copy both lines into your browser):

Message-ID: <mTraa.14955$3D1.1625@sccrnsc01>
Source record: 22843

As I'm sure it has been brought up before:

Isn't it funny that people that bitch about Ben's numerous post taking up 1) their hard drive space, 2) their bandwidth, 3) their time will post back and forth for 2 weeks taking up 10X more of the above then Ben does.

Is he NOT posting an ADV: before his advertising? whew! just killfile him if you need to....

# 1631. Graphix AT

The 1200XL keyboard has a bad connector between the mylar and the PCB. Once these contacts start to go bad, random keys will have a tough time registering. I think this is just affecting the least capable keys at the time, not any real defect in the keys themselves. If you pull the mylar off and lay it on the PCB while holding the connector tightly with your fingers, all the keys work well with just a light touch. The secret is to get the connector to make good contact. I wish we could solder it....

> printers.
>
> Jim

This is an old post from this newgroup:

The Graphix AT is a parallel printer interface manufactured by Xetec. The
switches are as follows (numbered left to right, 1 to 8)

1 - UP = Graphix mode (Prints text and Atari Graphics)
DOWN = Transparent mode (Prints text, passes control codes to printer)
2 - UP = Line feeds on
DOWN = Line feeds off
3 - UP = Pass 155 (Atari EOL) on to printer unchanged
DOWN = Convert 155 (Atari EOL) to 13 (ASCII EOL)
4 - UP = Set high bit to 0
DOWN = Pass high bit on to printer

Switches 5 through 8 select the type of printer: all down for Epson /
compatible, switch 6 up for Prowriter, and all four up for Daisy wheel
printers (which have no graphics)

The programs and text of C1BA are currently being scanned and proof-read for posting at atariarchives.org (with permission). Does anyone know if any of the type-in programs can be found already in machine-readable format? Ditto for the Second and Third books, since they will eventually be done, also.

The type-in programs are especially difficult, since nearly all have dot matrix print which makes OCR'ing results very poor. Typing them in from scratch is quite a bit faster in most cases.
Thanks,
Larry

Hi!

Where is the Checksum Routine stored in the XL/XE os? I want to get rid of it. So what do i have to do, to make the atari always boot, even when I modified the os, and did not change the CRC values.

Marius

I just took a look at some code on my harddrive (Bob Woolley's SmartIDE
code) and this is what he did:

```
*=$C31D KILL ROM CHKSUM
NOP
NOP
```

This may only be the 1200XL though.

Since you are working with a BASIC program, and sticking with BASIC error numbers...

164 is file number mismatch. You are probably using an Atari DOS to ENTER a program LISTED with some other DOS that does not use file numbers.

Try using other DOSes like MYDOS, MachDos, SmartDos, SpartaDos to Enter the program..then save it back(to single density if you must use Atari DOS with it).

Last resort is to use a Disk Editor to extract the program and save as a text file to another disk. Then start the Enter process all over.

> Thanks in advance,
>
> Chris Davis

I started with a HP LaserJet 2 that I used to print lots of plain text, using front panel controls to set font attributes.

I then went to a HP DJ500 and an Epson emulator cartridge that work with all of the A8 and ST software that didn't have a DJ500 driver. I created a driver to use Paperclip with it--without the Epson cart. I expect the PCL3 language is still valid with HP printers today using PCL5 or PCL6.

I bought a Canon Color Inkjet BJC-4100 because it was color and defaulted to an Epson code set for printing..easy to use with the A8, though I have not done much with it. And I used an LQ2550 color driver for the ST which worked O.k...the printer was faster than the ST!

The only thing to keep in mind is that the drivers usually expected to SKIP PERF/EJECT PAGE, so I used legal paper with them.

As mentioned in another post..APE will probably work well.

Visit websites...if it mentions DOS drivers, then it may support Epson codes.

You can get a sample of codes by setting the PC printer to "Print to File". Then print a sample document. By looking at it, or using a prog to convert the bytes to numbers, the printer codes can be picked out.

I suspect a lot of A8 libraries have many of the programs already saved to disk.
I'll look at mine.

Yes. I'd love an OCR app that can read dot matrix text!

Also, 702 ($02be) MIGHT detect control key pressed(bit 7). I had better luck
for the shift key using 53775 ($d20f).

You might be better off just checking each byte for being a control code
value(as prev mentioned), or even shifted.

The possibly best way is to always insert the proper checksum. (-; For all
the gory details, you might consider the sources of the Atari++ emulator
as it has to play with the very checksum itself, especially the
romxlchecksum.cpp source file. Here are some excerpts:

```
/// RomXLChecksum::CheckSum
// Run a word checksum over a range of the Os ROM, lo inclusive,
// hi exclusive.
UWORD RomXLChecksum::CheckSum(ADR lo,ADR hi)
{
class RomPage *rom = Machine->OsROM()->OsPages();
UWORD sum = 0;

// Offset the low and hi such that we get the right address within the
// ROM. Note that the selftest has its origin at d000-d800 and gets
// mirrored into 5000-5800
if (lo >= 0x5000 && hi <= 0x5800) {
lo += 0x8000;
hi += 0x8000;
}
// Now get the base into the XL rom. This is at 0xc000.
lo -= 0xc000;
hi -= 0xc000;

do {
sum += UWORD(rom[lo >> PAGE_SHIFT].ReadByte(lo));
lo++;
} while(lo<hi);

return sum;
}
///

/// RomXLChecksum::InstallPatch
// This entry is called whenever a new ROM is loaded. It is required
// to install the patch into the image.
void RomXLChecksum::InstallPatch(class AdrSpace *adr,UBYTE)
{
UWORD sum;
//
```

```
// Fix up the ROM checksums.
//
sum = CheckSum(0xc002,0xd000);
sum += CheckSum(0x5000,0x5800);
sum += CheckSum(0xd800,0xe000);
adr->PatchByte(0xc000,UBYTE(sum & 0xff));
adr->PatchByte(0xc001,UBYTE(sum >> 8));
//
sum = CheckSum(0xe000,0xfff8);
sum += CheckSum(0xfffa,0x10000);
adr->PatchByte(0xfff8,UBYTE(sum & 0xff));
adr->PatchByte(0xfff9,UBYTE(sum >> 8));
}
///
```

It starts at $FF73 and goes to $FFD6. I just put in a CLC ($18) for a
SEC ($38) at $FF90, but Shawn's method via Wolley's code also works.
I tried once for days to figure out a way to calculate a new CRC, but
every time I burnt an eprom with those values it would fail the test.
So I got tired of that and went with the CLC.

IIRC, it will show as a bad rom in the self test my way, but it will boot.

# 1652. The Internet-enabled Contiki Desktop OS

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-10 07:56:11 UTC
From: Adam Dunkels <adam@dunkels.net>
Message-ID: <pan.2003.03.10.07.51.18.304706@dunkels.net>
Source record: 22765
Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit,comp.sys.apple2

Hello c.s.cbm, c.s.atari.8bit, and c.s.apple2!

I am extremely proud to present version 1.0 of the cross-platform, open-source, Internet-enabled Contiki operating system and desktop environment. Contiki was originally intended for the the (unexpanded) Commodore 64, but also runs on the VIC-20, CBM PET, Plus/4, Atari 8-bit and the Nintendo Entertainment System (NES). Ports to the 8-bit Apple ][, Atari Jaguar, and a bunch of other platforms are under development. This first version of Contiki contains the following:

* Multitasking kernel.
* Windowing system with themeable GUI toolkit.
* Screensaver.
* TCP/IP networking with RS-232/SLIP or Ethernet (PPP support is under development).
* Personal web server for convenient file transfers (currently only on C64/TFE systems).
* Simple Telnet client (instead of the web server on RS232-systems).
* Web browser (the world's first true web browser for 8-bit systems!).

Everything is fully multitasking and does not require any loading of programs. Contiki does not require a disk drive or any other form of mass-storage devices, which means that it is useful both for disk drive owners and tape users.

See the Contiki web site for more information, a FAQ, lots of screenshots and for downloading the binaries or the source code:

http://dunkels.com/adam/contiki/

Contiki was written in the C programming language by me (Adam Dunkels) with encouragement, suggestions and support from Ullrich von Bassewitz, author of the cc65 C compiler. The VIC-20 port has been made in cooperation with Anders Carlsson, the Atari 8-bit port in cooperation with Christian Groessler, and the NES port together with Groepaz/Hitmen. Chris Morse is currently working on the Apple ][ port and Matthias Domin is working on the Atari Jaguar port. Lawrence Chitty is working on PPP support and on porting Contiki to the Sharp Wizard PDA, Fabio Fumi is porting selected parts of Contiki to the Casio PocketViewer, and James Dessart is porting Contiki to the Tandy CoCo. Mikael Backlund has drawn the Contiki desktop icons. Huge thanks to all for making this possible!

# 1653. Accessing my old BASIC programs

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-10 12:35:39 UTC
From: Wrath0110 <email.name.withheld@attbi.com>
Message-ID: <u30p6vc9n3cqsrg4587ai6eb1nafqg71hh@4ax.com>
Source record: 22766

Hi All! Bob here. Well, my trusty Atari 800 is up and running again. I had most of it in boxes on the top shelf of my closet, a fate shared by several other pre-IBM platforms.

In the late 80s I spent significant portions of my time writing hobbyist software in Atari BASIC. Now I am worried about the lifespan of the media that all of that code is stored on. It's all still accessible today, but I sure would like to port all of it to the PC for archive purposes. (I wouldn't mind being able to run this old stuff on an emulator either.)

Approach 1

So I sat down with the Atari right next to my PC with the intention to print my programs to paper and then scan and OCR them into the PC realm.

What an utter waste of time. The very first program, a small one-pager, proved what was wrong with my concept. Here's a snippet:

```
i'I:;:'CI~'!Jr!-.,
,J. ,1, rl J. -.., ..
1 '~~ f::.I=,t;::E~ ("5:~ .' j
;~(~1 .:;F~~TC:!:,I-.I:IF:: :2: ., .' ;.::'
::~~t !~:: !:)li:;F;: 1
,'fi;::! FI:I~::
1. TI~i ;1 [.~E:,':T
., l,~fif.:LI:~IF:[;' ' ,
```

A run-down ribbon coupled with a ancient dot-matrix font coupled to make this the results of my labor.

If I choose to pursue this approach there's another problem: I used to use a mixture of Atari BASIC, custom tools (Like SuperFont), known tricks in assembler, pokes and screen manipulation in concert in my programs, so merely reading the code can be an adventure.

Approach 2

My second thought was to link my Atari to the IBM somehow, but looking around I don't see any easy way of doing this, short of finding a working 850 or ATR8000 (neither of which I am enamored of, having done all that in the 80s with less than optimal success.)

I have to admit that I was hoping for a simpler solution, like an adaptor for a connection to a router. Has anyone given any thought to a simple interface device that would bring the Atari onto the net?

Approach 3

I suppose another answer might be a 3.5-inch diskette drive for the Atari 800 that uses an IBM formatted diskette. *sigh*

Addenda

On an administrative note, I've obscured my e-mail address to thwart spammers who grab all of our conversations from the UseNet and pepper us with crap e-mails. Please reply to the newsgroup.

Adam,

I just read about this on Slashdot.

You scare me.

Seriously, *GREAT* work. I can't wait to try it out. I know an SCPU isn't
required, but will it run in 20MHz mode?

Thanks!

It probably will run on the 65816 in 6502, since it does not do
anything special or tricky on the C64. It won't make any use of the
extra RAM, however.

/adam

Sorry, I do have the data sheets at home, about 40 pages of text and graphics. And it clearly tells you how to upgrade it so that it will use colours. How many bits are to be used for each colour is up to the developer. An extra multiplexer is needed plus some other stuff.

Hmmm. It seems we've got different versions of the datasheet.... :-(

I just had a look at my datasheet and discovered a short section about
external attributes that I missed when I wrote my last posting. Sorry.

Here's the full text (typed in by hand from the scanned PDF,
so there may be some typos...):

---- 8< -------- 8< -------- 8< -------- 8< -------- 8< -------- 8< ----
5.0 Extra Attributes

One may want to expand the external attribute field by adding more bits
so that functions such as color (Red-Green-Blue drive) or grey scale
may be implemented. Like the eight attributes which the chip handles
internally these extra attributes would operate on a character cell
basis. To add attribute bits one would have to duplicate the internal
4 level character/attribute FIFO externally using fast MSI chips. To
assist in handling the external FIFO circuitry the TMP features two FIFO
clocking signals on pins 17 and 25. The FIFO IN Clock (/FICLK) is used
to strobe attribute data into the external FIFO circuits in synchronism
with the internal TMP FIFO. Its timing is identical to /RAMRD but is
only active when the video does a display RAM read to load its FIFO. The
FIFO OUT Clock (/FOCLK) pulses for 1-3 bit times each time the video
starts the display of a new character cell. The external FIFO would
use the rising edge of this signal to clock out or latch the attribute
output.

In order for the TMP CPU to access the additional attribute bits special
bus gating arrangements would have to be worked out on the System
Bus (Video Data Bus is at most 16 bits wide). Unless one were to run
with internal attributes or only use a few of the external attributes
in which case the unused bits could be used with the external FIFO.
Whenever using the /FOCLK the intensity attribute is disabled since they
both share the same pin.
---- 8< -------- 8< -------- 8< -------- 8< -------- 8< -------- 8< ----

Please let me know if your docs are clearer, maybe you could post
some of the interesting parts.

so long,

Hias

# 1663. New OS?

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-10 16:57:28 UTC
From: Spamless <Spamless@Nil.nil>
Message-ID: <3e6cc3f8$1_2@nntp2.nac.net>
Source record: 22775

[from slashdot: http://slashdot.org/]

Adam Dunkels writes "This is for those of you who think that a text-based operating system that fits compressed on a 1.44Mb floppy counts as 'tiny': the brand new Contiki operating system [http://dunkels.com/adam/contiki/] and desktop environment for the Commodore 64, with ports to a bunch of other platforms [http://dunkels.com/adam/contiki/ports/] such as the 8-bit Nintendo Entertainment System, the VIC-20, 8-bit Ataris, Atari Jaguar, the Tandy CoCo, and the Apple ][ under development. The Contiki system includes the following: a multi-tasking kernel [http://dunkels.com/adam/contiki/ek.html], a windowing system and themeable GUI toolkit [http://dunkels.com/adam/contiki/ctk.html], a screen saver [http://dunkels.com/adam/contiki/apps/screensaver.html], a TCP/IP stack [http://dunkels.com/adam/contiki/tcpip.html], a personal web server [http://dunkels.com/adam/contiki/apps/webserver.html], and a web browser [http://dunkels.com/adam/contiki/apps/webbrowser.html]. The Contiki web browser, which is likely to be the world's smallest browser given its extremely small memory footprint, is the world's first true web browser for an 8-bit system and probably makes the 21 years old Commodore 64 the oldest system ever to run a real web browser! All of the above programs are contained in a single, fully self-contained, 42 kilobytes large binary. The entire Contiki system with all programs running simultaneously is comfortable in 64 kilobytes of memory. The name 'Contiki' is derived from Thor Heyerdahl's famous Kon-Tiki raft which was able to sail across the Pacific Ocean despite being built using prehistoric techniques, something previously thought impossible. There are also screenshots [http://dunkels.com/adam/contiki/ss.html] and a FAQ avaliable [http://dunkels.com/adam/contiki/faq.html]."

Look for documentation on the web for SIO2PC cables. There are two basic designs for them with the 1489 version being easiest having been completed by many as there first time project and the MAX232 version which is a more robust design.

They are frequently forsale on eBay at ~$25.

The two most popular software packages are SIO2PC and APE. SIO2PC has a really small footprint, it can run on an 8088 with a floppy drive. APE has a Windows version that naturally takes more room.

There is a learning curve you have to go through with the SIO2PC and possibly emulators on the PC to get everything squared away. Archiving will be no problem but you may have to resort to other tricks to get a print out if you used any of the special Atari graphics characters in your program. A straight bit map dump of the screen data works if you don't install a special character set.
<snip>
> I suppose another answer might be a 3.5-inch diskette drive for the
> Atari 800 that uses an IBM formatted diskette. *sigh*

You can use an ATR8000 or modified XF551 with 3.5" disk in 720k format to transfer files. IMO these are both less then optimal solutions since you will be spending a large amount of money on hardware and end with less functionality in the task you have at hand.

Right, $0000-$3FFF. There is no RAM under BASIC or OS ROM as it ends at
$3FFF and can't be mirrored to another location AFAIK.

# 1670. Re: Need information about Turbo cassette formats

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-10 18:42:17 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3E6CDC89.6095605A@students.uni-mainz.de>
Source record: 22782

Well,
there were many turbo Tapes in the 80`s and 90`s. Some were software based, while others (mostly faster ones) were hardware based. I do remember a programm called Filecopy x.x (had a red screen and white text) which could copy c=>c, D=>D, C=D, D=C (i.e. a Tape-Disk Copier). when you copied something to tape, you could use short or long IRG and 600 or 800 baud; in the german magazine computer Kontakt they had a simple basic programm called Speed Tape - this one should work with approx. 1000 baud; in a later CK magazine (or maybe the german Atari magazine) they had a program called CBAUD plus a special copier program; the copier program could convert 600 baud tapes into 1200 baud tapes; CBAUD.COM was the loader program for these 1200 baud tapes; Ok, this was the software side...

Now, the hardware, I do remember the eastern german turbo 6000, which worked with 6000 baud, the czech or polish turbo 2000 that was only named turbo 2000 in the 80s or 90s (2000 = ahead of its time!) but worked with varying speeds. at least Bewesoft provided some software for his Bewedos, where one could load Bewedos from a turbo 2000 tape with varying speed; don`t know how fast the turbo 2000 really is. Surely Jindrish can tell you more about that. Maybe Sven Gleich can tell more about the eastern german turbo 6000 tape (he has schematics on his homepage for that). Finally there was the british RAMBIT turbo tape, sold by Derek Fern (Microdiscount) and others. It claimed to have a speed of 9600 baud. Most programs by Microdiscount could be bought as Disk, Tape or Rambit turbo tape in the 90s... -Andreas.

yet another *wow*! You totally beat me to the punch on this one, and
definitely pulled it off better than the project I had planned!

I'm actually quite a fan of cooperative multitasking due to its efficiency.
It's nice to see it still used in a world of preemptives.

Please read again. There's a difference between a "kernel" and a "kernal". A "kernel" is a core of something, while "kernal" is used in the Commodore world when talking about the ROM containing the operating system. So

* Multitasking kernel

does just mean that the Contiki core contains features to allow different apps to run at the same time.

And, because Adam was talking about a "kernel" (not the "kernal"), there's no need to swap any ROMs.

Regards

Uz

An OS that allows millions of people to get their work done is not bad. Bad
are the (in relative terms) handful of geeks that spew BS about their own
sluggish, bloated and unfriendly OS and the even fewer diehard antique fans
who are in denial.

If it's fun, do it but don't compare your little toy to the millions of seriously powerful PC's out there that get real work done in the real world. Windows is an OS that despite a few issues satifies the demands of millions of everyday users worldwide, like it or lump it.

No amount of illogical and illinformed BS from you is likely to change that fact anytime soon.

Why run down someone elses very real accomplishment? Perhaps because your own accomplishments are all imaginary (if they are real, why haven't you shown them to anyone?)?

>Well, it must be nice to offer Windows enthusiasts an alternative to
>their damnably bad OS.

Windows is _so_ bad... that thousands of major corporations choose to use it after their information technology professionals compared the pros and cons of using Windows to the pros and cons of using all of the other available operating systems. Explain that if you can Matthew.

Best regards,

Sam Gillett aka Mars Probe @ Starship Intrepid 1-972-221-4088

XAGON was written by my good friend David Pentecost.

XAGON and Qb (I'm the author of that one) were developed
independantly, pretty much at the same time (around 1983). We shared
tools and utilities. The game was released to the Melbourne Atari
Computer Enthusiast's group (MACE) around 1988ish.

Yeah - I got one of those a few years back. It's called "Stunt Cycle"
and it has 4 game variations. Neat to have in a collection, but the
fun factor wears off much faster (IMHO) than with a Pong or Atari
Video Pinball unit.

On Mon, 10 Mar 2003 22:51:05 GMT, "LS" <lannie@me.com> wrote:

With all due respect for your other, non-destructive comments (which have become incredibly rare recently, though), this certainly wasn't called for, was it?

On Mon, 10 Mar 2003 14:35:38 -0800, Matthew Montchalin <mmontcha@OregonVOS.net> wrote:

[...]

Do I sense an ever-growing frustration that - as if unreflected comments about PC systems per se weren't enough - now doesn't even stop from hard (and, as far as I can judge it, damn well-done) efforts to innovate a part of the 8 bit world? Jesus!

Personally, I admit I can't yet join in into the euphoric comments here, as I'm lacking the possibility to connect my "real thing" to the internet (seeing as I don't have analog lines, my old RS232 interface plus a modem won't do me any good, I think), but what I can say is that it looks and feels very, very impressing, and it's one of the coolest UI I've ever seen on the 64 (Oh well, I've never had Wheels or CLIPS, admitted!). _If_ the net connection works (And why should Adam kid us?), that's really a major achievement, nothing less!

But maybe it's not good enough for your very own high standards - which is understandable seeing how innovative and brillant _your_ CBM-related work is... Too bad hardly anybody ever saw it, though...

Did you actually _see_ Contiki, yet? I mean, what with all your self-made PC trouble and stuff? How were you supposed to download, extract, and, if necessary, convert the D64 Adam provided, anyway?

Oh, you didn't. Great. Speaks volumes about your comments...

With regards to Adam, though, two thumbs up. Now if VICE only provided a means to make use of the PC's internet connection, I'd love to try the browser and telnet features myself. Maybe someday...

Anyway, keep it up, Adam, and don't let jealous, stick-in-the-mud dogs in the manger irritate you. Oh, and thanks for not doing anything tricky that prevented Contiki from running under PC64/DOS, even ;-) !

Greetings,
Chris.

Yer jumpin' the gun!

>|* Windowing system with themeable GUI toolkit.
>
>Well, it must be nice to offer Windows enthusiasts an alternative to
>their damnably bad OS.

Whoa!! Mathew apparently has some ISSUES!

Doing a quick search, I found a nice little comment on Mathew in
comp.sys.cbm that went a little something like this:

""One -- Matthew Montchalin -- is so mindless, he deserves special
mention." ... "He is not only immoral, but amoral." ...

And Mathew's own words in another CBM posting:

"Finally, to discourage PC lamers from logging in, a conspicuous
message at the front of the BBS could inform them that PC users are
encouraged to log out immediately before they contract a computer
virus that will destroy their hardware. That way, your BBS line stays
free of idiots that tie it up for no logical reason."

If any "PC lamers" would like to drop Mathew a personal noce, feel
free to write a letter and send it to his home address:

Matthew Montchalin
1823 N Coast Hwy 101
Newport, OR 97365-2022

Maybe a copy of Windows 3.1, so he can upgrade his machine.

Hope you get what you need, Mathew!

Why worry about ROM replacement. Just a good plugin cartridge and bank out BASIC/KERNAL/DOS ROMs.

If you are really creative. How about a cartridge with a CF interface. I am really impressed. I think the concept is a great concept to adopt some principles for in a more advance project.

Please spare us. I often wonder how many of the "seriously powerful
PC's" end up doing nothing much more than screen saver duty or
generating the same quality and quantity of correspondence seen in
1980's era bbs's running off floppy drives.

I think its fair to say Windows has more than a "few" issues.

(1) That's not exactly legal.

(2) The Jaguar was a 64-bit game system released in the early 1990s.
It has its own newsgroup (which I also subscribe to),
alt.atari-jaguar.discussion. This newsgroup (comp.sys.atari.8bit)
is about the 8-bit Atari computers released between the late 1970s and
late 1980s or so.

Sorry!

Although it would free more RAM if Contiki was put into EPROM and
somehow replaced the firmware (minus the Kernal routines called
from cc65 libraries).

Actually, Contiki was written for the Commodore 64. When Adam tried
to test compile it for other cc65 targets, like the vic20, it runs
out of the box once we fixed the Makefile. Of course, fine-tuning
will be required to make a GUI that fits each platform.

I'm not sure how much "fine-tuning" the NES, Atari 8bit, Apple II etc
ports require to run a base system, but as long as it is a supported
target for the compiler, it might run out of the box?

I sincerely hope that the following question does not cause any
unnecessarily heated discussion. However, it is something that is
inevitably going to be asked sooner or later: Is the license
intentionally GPL-incompatible?

I'm looking at my Coleco Adam sitting underneath my Apple //e, and I'm thinking he might get even more jealous...

What are your thoughts on a Z80 port... I've seen portable C compilers for the PC that compile Z80 code (not cc65 obviously, sdcc), and C should be fairly portable, but a Z80 isn't a 65xx chip...

If I had a serial card (for the Adam) or even a 5 1/4" IBM floppy (I have a 5 1/4" drive for the Adam), I'd volunteer to try to port it.. Not much of a programmer, but my experience is with C...

Still, if no one else is willing, I'd try it. (Using an emulator for now..) I'm thinking I could (assuming the processor issue isn't too major) get it to work without serial I/O. (Like what you've had on the Vic-20)..

Interesting side note, if a Z80 port is viable, what would that mean for an Apple II with a CPM card?? Run 2 versions? 6502 and Z80? What about some of the other Z80 boxes out there???

Might be beyond me, but still interesting...

Well, a ROM replacement would be the best way to do it, and one that I would approve of. No need to 'run' anything when you can just slap your own startup into $fffc and take it from there. The *best* way to do it.

I just wanted to thank everyone for all positive reactions we've (the Contiki guys) have got! There has been an amazing number of emails in inboxes and mailing lists, and after Contiki was posted to Slashdot, the Contiki web site was quite overloaded for a while.

The Contiki web site had 30000 visitors over a period of about 15 hours yesterday, with a total of 155000 Contiki pages loaded! The screenshots were loaded an amazing number of times - 1600000 (yes, 1.6 million) times!

Indeed. Cooperative multitasking is definately the best option for a
system like Contiki running in such a constrained environment.

A Z80 port of Contiki should definately be possible, given a good C
compiler. I don't know the current status of sdcc, but I have heard
that there have been problems with their Z80 target and the uIP TCP/IP
stack in the past. Those issues may very well have been resolved by
how, however.

Contiki already runs on other architectures than the 65xx family: x86,
68000, 6809 (I think).

Groepaz has been talking about a GameBoy version of Contiki, so there
are others who are interested in Z80 ports as well.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

A huge favour that is too simplistic to ask:
I am very unsophisticated regarding which files to download & run on my 64/128 to this all going. Could someone suggest step 1,2,3 etc. what to do from which files to download, to how to make them c64 usable to what to do with the files in term of running?

BTW I remember the expedition & read the book, but forget what kontiki meant.

Thanks
John Elliott

For Mac OS X, groepaz hinted me to a page that might be of interest
for getting network connectivity for emulators under Mac OS X:

http://chrisp.de/en/projects/tunnel.html

I have been using the FreeBSD tun interface to get packets in and out
of Vice under FreeBSD. Does Vice work on Mac OS X? If so, does it
support RS-232 emulation? In that case, the above tun interface for
Mac OS X should make it possible to actually run Contiki with Internet
connectivity.

With Vice 1.6 on a Linux or FreeBSD host, it is possible to use the
RS232 emulation and use a physical serial cable between the PCs
two serial ports, and run SLIP between the PC and the emulated
C64. This is how the screenshots on the Contiki web pages were made.

> Oh, and thanks for not doing anything
> tricky that prevented Contiki from running under PC64/DOS, even ;-) !

A lot of the Contiki development was done under Vice, so there
definately are no special tricks that are supposed to make it hard
running Contiki in emulators :-)

I am not interested in any of the so-called "discussions" that usually
follows questions like this :-), but I will answer the question:

No, there is no intentional decision to make the license incompatible
with the requirements of the GPL.

Yes, that would be very nice. A native VDC version would be quite
interesting to see as well.

I am not sure, but I think there is a C128 80-column implementation of
the conio API for cc65. That would make it extremely simple to make
such a version: just set the correct compilation options, recompile
and run :-)

What RS232 options are there for the C128?

No, that would probably be little tight :-)

The port that runs on the 6809 (the Tandy CoCo port) does have a
little more RAM than that, though :-)

Howdy Matthias

> Hmmm. It seems we've got different versions of the datasheet.... :-(

I've got my xeroxed copy from Hans Christof Tuchen. I tried to copy them once, but it lost to many details, maybe I can scan them with less loss of detail but that'll have to wait as I don't have time for those kind of things at the moment. And it's about 40 sheets of A4 paper (for non-Europeans, that's slightly higher and slightly narrower then the Letter format). Each sheet containing two pages.

> I just had a look at my datasheet and discovered a short section about
> external attributes that I missed when I wrote my last posting. Sorry.
>
> Here's the full text (typed in by hand from the scanned PDF,
> so there may be some typos...):

I checked out my stuff yesterday. It's on pages 7-68 till 7-72 on my data sheets. So I guess that's more text then what you have. There is also a part on adding up to 64kB of memory and even memory banking is discussed shortly. The NS405's databus can be 16 bits wide.

Remind me in two weeks to scann this stuff.

Such a shame that it's written in ANSI-C, and not K&R C, otherwise I would've
been running it on a PDP11..

Have you tried ansi2knr? Has anybody tried porting Contiki with bcc
(Bruce Evans' C Compiler) to 8086-based platforms? It's a K&R
compiler whose --ansi option is based on ansi2knr, I think.

Now *that* would be quite nice; it would make Contiki every a few
years older :-) When was the PDP-11 released? 1975?

How much work would it be to convert the existing ANSI C code to K&R?
The most evident part is the function prototypes, but these could be
handled the same way the BSD code does, by using a __P() macro. How
are function arguments handled? In K&R, these are put after the
function preamble (or whatever the "int func(int arg)" is called) and
not inside it. Perhaps several __P1(), __P2(), etc., could be
defined, and these could automatically choose the correct "preamble"
type.

I just want to say what Rick said, basically.
You can do a APE/SIO2PC cable pretty easily.
I think it is the way to go.
Seems like it is Clarence Dyson has the sio2pc,
the 14C89 one, or plain 1489. The MAX32 is
more robust, I guess, meaning more reliable, but
the 14C89 is what most people do. You can build
one, or buy one. The APE software. Steve Tucker's
site has the APE software, Windows version I haven't
done much with, I still use 1.17, which is for DOS, but
I use it in a windows command prompt. I suggest using
the DSR line instead of the RI line, is the only modification
of the schematic at Dyson's I'd suggest.
Steve Tucker sells the cable and the software, but you
can probably find a cable cheaper on ebay. And
Steve's APE for DOS is pretty functional, but I think
it is disabled for what you want to do (Atari to PC
transfers), which it will still do if you use SpartaDOS
and XDIR for extracting files to PC.
But I ramble.

Hi Anders,
Is the Vic version out for dload? Is it possible to make an TFE card that will work for both the vic and c64, say if it attached to the user port, so that a person would only need to have one? A vic on the internet! Ha! THAT is cool! And hooked up to cable at that!

> years older :-) When was the PDP-11 released? 1975?

The PDP-11/20 and 11/15 saw their first light in 1970. The last model in
1990...

> How much work would it be to convert the existing ANSI C code to K&R?

I don't know, I haven't taken a good look at the sourcecode, yet. There
are some annoying features about K&R which introduces possible problems in
combination with the platform, though. The PDP-11 is a 16-bit platform;
ints are therefore 16-bits too. If a program assumes that ints are 32 bits,
there might be issues. Even worse, if a program assumes that some datatypes
are issues, there might be problems, since K&R doesn't do automatical
typecasts.

For instance, the seemingly perfectly valid

```
fseek(file_descriptor,0,SEEK_SET);
```

goes terribly wrong - but you won't get any warning or error from that. It'll
just bomb out during runtime. Instead, it should have been

```
fseek(file_descriptor,0L,SEEK_SET);
```

In other words, "it compiles" is not the same as "it works", to put it
mildly :(

There's a reason why Ansi-C is so much better ;0

> The most evident part is the function prototypes, but these could be
> handled the same way the BSD code does, by using a __P() macro. How
> are function arguments handled? In K&R, these are put after the
> function preamble (or whatever the "int func(int arg)" is called) and
> not inside it.

Yes. A typical main() would look like

```
int main(argc, argv)
int argc;
char *argv[];
{
```

```
printf("Hello world\n");
}
```

A correct prototype would look like

```
main()
```

;)

A common practice (and I think BSD's __P() does something like that) is
to make your prototypes look like

```
int main PROTO( (int argc, char *argv[] ) );
```

with PROTO(x) a macro, defined as

```
#define PROTO (x) x
```

on ANSI-systems, and as

```
#define PROTO (x) ()
```

on K&R systems.

> Perhaps several __P1(), __P2(), etc., could be defined, and these could
> automatically choose the correct "preamble" type.

Similiarly, for the function definition, you could make your definition
look like

```
int main DECL2( int, argc, char **, argv)
```

with DECL2 being defined as

```
#define DECL2 (t1,v1,t2,v2) (t1 v1, t2 v2)
```

on ANSI systems, and

```
#define DECL2 (t1,v1,t2,v2) (v1 v2) t1 v1; t2 v2;
```

on K&R systems.

Things get particulary annoying if you have const directives, though :-/

I'll take a peek at the code RSN.

No, I hadn't even heard of it yet :)

Unfortunately, I don't think it'll solve the job. While it probably will
correct declarations and definitions, there are other nuisances about K&R C
which probably won't be caught.

Well, yes. Every now and then the topic returns on the various ancient Unix
lists and groups. Somebody really should make some time and see whether the
Amsterdam Compiler Kit[1] can be backported..

Martijn

[1] Which is the Minix compiler, for instance. It used to have a PDP11 backend,
and it does understand Ansi-C. And it's covered by a BSD-style license,
which makes things even better :)

|...what about using the 80 columns screen of the C128?

What about using both video outputs for separate video displays?

You seem to forget that the C-128 has two separate screen displays
that can be enabled simultaneously, quite handy if you REALLY have
to see some kind of a hi-res graphic image on one screen, and
continue with some less impressive graphics on the other. (Or so
I should think, but you WOULD have to buy two monitors to plug into
your C-128.) But what the heck, maybe it already does that, he just
hasn't documented it yet.

cc65 has an extended memory APIï¿½that could be used to make use of the
various kinds of memory extensions, not only the 128 kb of C128 RAM,
but also REUs and the 64kb of extra graphics memory that is available
on certain kinds of C128Ds.

> I hardly dare to ask if it would be possible to make use of the 2 MHz

Ullrich von Bassewitz have already started adding code to cc65 which
makes use of the 2MHz even in C64 mode... :-)

Yes, there are such plans :-) A caching module which makes use of
external memory and any disk drives when the memory runs out would
not be very hard to do, and definately have many benefits. There are
no problems in making it cross-platform either.

Ok. That would probably not be any problem as far as Contiki is
concerned. The only assumption Contiki (or rather, uIP) places on the
C types is that there are 8-bit and 16-bit types - does the PDP-11 C
compiler have a 8-bit datatype? If not, uIP will not work.

Ok... that may be a problem. Does gcc notice problems of this kind
when run with -pedantic or similar options?

Not in the current version. Mouse support can be implemented as
part of the CTK theme engine for platforms that have mice, once the
support functions are present in the main CTK code. There was not
enough time to implement it in the 1.0 version, though.

> It's all still accessible today, but I sure would like to port all of it to the PC for archive purposes. <

Since you mention that you would like to be able to execute programs on an emulator, then you probably will want to convert your disks to ATR images for your PC.

There are so many ways to do this that you would be well served to read the FAQs, especially section 10 which deals with "interoperability". Check out: http://www.faqs.org/faqs/atari-8-bit/faq/

If you have more than a few disks, you will likely want a cable interface, but there are several interfaces/software, so even within interfaces, there are choices.

To specifically answer your question without knowing more, my choice would be an APE cable and either Atari 810 or APE for Windows software. Note that one pin assignment in the interface differs for these software packages.

Some other sites you may wish to check:
http://www.atarimax.com/ (APE)
http://www.retrobits.net/ (Atari 810)
http://www.sunmark.com/ (SIO2PC PC board -- also auctioned on eBay)
http://strony.wp.pl/wp/j131atari/ (Polish SIO2PC cable sale)

One last item -- *if* you elect to build your own cable, the 1489/14C89 version is easier. There is no performance difference between the MAX232 and a well-built 14C89.

(I can send you ansi2knr - e-mail me.)

For 8086 couldn't you just use Turbo C++ (for DOS anyway)? It has
NICE ways of getting down-and-dirty with the hardware: geninterrupt(),
inportb(), outportb(), _AX, _BX, _CX, _DX, _CS, _DS, _FLAGS, _AH, _AL,
etc. And none of that requires an OS (hope you have TASM handy) - I
cross-compiled some test code to CP/M-86!

More interesting to me, is any support for 80-col/VDC graphics? A lot of people find pure C64 GUI stuff drool-worthy, but beyond technical astonishment it does nothing for me. I've been in 80-col world for so long unless the Contiki graphics system can be extended to VDC on C128 I don't see ever trying it.

Also I couldn't tell whether the 3 applications (http-in, http-out, and telnet-out) are built into the OS or are actually applications you load and run. If more applications are written, is this like a regular OS that they can be delivered individually or are they compiled into the Contiki binary and released that way? Some of the source code made me think the latter, but I only skimmed it.

Alex

Yes, the Contiki graphics toolkit can quite easily be made to run with
80 columns on the C128. All it takes is an implementation of the cc65
conio library that runs in 80 column mode on the C128. I am not sure
whether such an implementation already exists or not, but a skilled
programmer probably could crank one out in a few hours, especially
since it only needs a single function.

If someone would like to, it is also possible to make a graphical CTK
theme for the C128 80 column mode, similar to those that exist for the
C64.

Currently, all programs are compiled into one binary, but there
already are support in the cc65 runtime for loadable program modules
that will be used to support loadable Contiki programs.

Hi, Jim;

Eight DIP switches numbered 1-8 left to right.
Up is on; should be marked near switches.

#1 is Graphics control:
ON prints text, converts control graphics (<32 and >127) to ATASCII shapes.
OFF passes all text and codes to printer transparently.

#2 is Auto Line Feeds:
ON adds a line feed to each carriage return.
OFF sends only the return from the interface and relies on the printer to
supply the line feed.

#3 is End of Line conversion:
ON passes the 155 unchanged; preferred OFF without extraordinary
circumstances.
OFF converts the ATASCII 155 EOL to a 13 printer carriage return. Normally
preferred.

#4 is 7 or 8 Bit ASCII:
ON converts all data to 7 bit by setting the high bit to zero. Prohibits
printing inverse (>127) ATASCII graphics, and is only needed with some old
software which sets the 8th bit to one.
OFF passes all 8 bits as received.

Xetec recommends setting #1- #4 OFF for all packaged software; exception may
be #2 if printer is not configured to give line feeds.

#5 - #8 are Printer selection control; 18 specific models were listed with
appropriate settings. Epson, Gemini and Star models set 5, 6, 7, and 8 to
OFF; all non-graphics daisy wheel types set 5-8 to ON. Okidata sets #5 ON,
NEC/Prowriter sets #6 ON, Legend/Blue Chip sets #7 ON, Axiom/Banana set #5 &
#6 ON.

Special Codes to interface in Graphics mode SW #1 ON.
ESC 6 selects 6 lines per inch
ESC 8 " 8 lines per inch
ESC T selects transparent mode as if SW #1 OFF
ESC G select graphics by cancelling ESC T
14 (Ctrl N) select expanded width characters
20 (Ctrl T) select compressed width characters
15 (Ctrl O) cancel expanded and compressed widths
*Note: may not function with all printers.

Use with 1200XL requires modification to supply +5V

Sob... That's the point - I'm a Windows user (Yeah, Matthew would say
that then I didn't deserve any better ;-) ...), you know, the OS that
crashes if you start WinVICE 128 or surf to www.google.com. Or so I've
heard ;-) ...

Well, I hope someone from the VICE team will sooner or later have
mercy with us and implement this networking stuff into the Windows
version, too. Alternatively, I may look ut for an XL or Apple emulator
that provides this feature (Would be surprised if they existed,
though, but maybe some nice chap from the other two groups could
comment on that?) and use that port for just experiencing "8 bit
internet" for a while...

Greetings (and congratulations to your incredible number of hits,
hehe),
Chris.

>
> ...what about using the 80 columns screen of the C128?

On the Atari 8-bit, you can get a fairly fast 80 column display by alternating
the display and the character set used. (Sure, that adds another 2K to
what you're doing: ~1K for the screen data, and 1K for the char. set,
but it works :^) )

FlickerTerm 80, a modem terminal program, is an excellent example.

Say you had the word "Computer" on the screen.

Frame 1, you display the first font (see below), and show this text:

Cmue

Frame 2, you display the second font, and show this text:

optr

The fonts are identical; 4 pixels wide by 8 pixels high. One is just on
the left half, the other on the right:

```
------- --------
-#----- -----#--
#-#---- ----#-#-
#-#---- ----#-#-
###---- and ----###-
#-#---- ----#-#-
#-#---- ----#-#-
------- --------
```

So between the two frames (ever 30th of a second), thanks to persistence
of vision, you get 80 columns. Inverse-video is tricky, though. :^(

It's definitely faster than using 320x192 bitmap mode. :)

(Also, due to the slight timing difference, you can have 4-pixel-wide
letters, like "M" and "W" that are a bit less unreadable than if it weren't
flickering :^) )

I remember hearing something like this. This was regarding the platform,
though, not the software (games).

Besides, many of the games weren't developed by Atari, so they don't
have the right to release them 'freely' to begin with.
(Lots of the software was licensed by development houses.)

I'm sure someone in the Jaguar group can talk more about this.

- QS FORTH [QS] Quality Software
version, year : 1.0, 1981
author/company : James Abanese / [QS] Quality Software
available..... : then -- commercially, now -- Who knows?
package....... : Editor, Assembler, I/O routines
Single Density 5.25 Floppy and Manual in Binder
features...... : Editor, Assembler, I/O Routines
QS FORTH requires an Atari 800 computer and at leat 24K
of RAM. QS FORTH requires an Atari 800 Personal Computer with an Atari 810 Disk
Drive. QS FORTH is based on fig-FORTH. The QS FORTH manual is published and
copyrighted by Quality Software, Copyright (C) 1980 By Quality Software. FORTH
is a trademark of FORTH, Inc. Use of the term "fig-FORTH" refers to the public
domain software distributed by the Forth Interest Group of San Carlos, CA, who
are not responsible for the production or support of this product. ATARI 800
and ATARI 810 are trademarks of Atari, Inc.
This version of FORTH is based on fig-FORTH, a
common model of FORTH distributed in the public domain by the FORTH Interest
Group of San Carlos, California. The fig-FORTH model is made available to the
public in document form, listed partly in machine code (in this case 6502 code)
and partly as FORTH definitions. It has become the standard version of FORTH
for microcomputers. Quality Software has expanded, but not significantly
modified, the fig-FORTH model in an effort to make it compatible with the
special features of the ATARI 800 computer. The enhancements we have added
include a screen editor, an I/O module that includes printer interfaces,
graphics commands, sound commands, and is designed to facilitate setting up
input and output operations, an assembler that allows incorporating 6502
subroutines into the user dictionary, and an extension of fig-FORTH that
includes several additional handy words.

[ Note: I have found a version of Atari fig-FORTH that comes on a SpartaDOS disk. Is there a version of fig-FORTH on a MyDOS or DOS 2.x disk? ]

I have an ancient floppy disk I ran accross that is an a commercial ATARI paper
jacket:
Part:
CX8121 Programs (C) 1981 Atari, Inc. -- * Macro Assembler, * Program-Text
Editor
[ Note: I believe that this is what they call the "Asm Disk" ?
I remember the program editor. It was a hideous "split screen"
arrangement with a display area on top and an entry line on the
bottom.... ]

- - - - -
About RAMdisks....
I am not sure whether or not you have this one listed, but it is one that
everyone forgets. This is the ATARI 800XL DOS 2.5 "nothing" enhancement. If
you have an ATARI 800XL and DOS 2.5, you can initialize a RAMdisk by formatting
it with 'I' and 'H' and then writing DOS.SYS and DUP.SYS system files until it
"errors out". When you erase all of the sectors, you are then left with a
RAMdisk of 105 sectors. While this isn't very big, it is large enough to hold
UNARC, which -- when working from RAM -- speeds up program execution quite
considerably!

I wouldn't guess so, it depends on how smart you print characters. I've
here a (pretty simple) terminal program at hand that uses 80 column graphics
by the Antic F mode. Characters are of course rendered to the screen the
"traditional" way, but the main speed break is scrolling if you perform it
"the lazy way". With some smart display list tricks, you can scroll a 320x192
screen without moving a single byte. The terminal program in question does not
implement a VT-xxx terminal, tough, but a private terminal protocol for a
remote debugger I wrote years ago for the Amiga (using the Atari as remote
terminal, that is). Maybe I can still dig out the sources if this is of any
interest.

Greetings,
Thomas

The 11/20 and 11/15 typically have only 12KW of core, that's probably going
to be a bit tight. Another issue is that you do want to run some kind of OS
too, and since most PDP11 OS'es are still covered by expensive licenses.
The only "usuable" free OS I know of is 2.11BSD, but that requires a more
modern CPU. (22-bit adressing, 512KW memory). It'll run happily on an
emulator, though.

> Does the PDP-11 C compiler have a 8-bit datatype? If not, uIP will not work.

Well, *this* compiler does - (unsigned) char comes to mind.

No, since -pedantic forces strict ANSI compliance, and implicit typecasts
are perfectly valid in ANSI - especially when you're promoting datatypes, as
it's the case here. To make things worse, this phenomenon only occurs on
systems where ints don't have the same length as longs.

Unfortunately, this won't work well together with the RS232 routines. Since the VIC has not enough cycles left to display anything in 2MHz mode, slow mode must be enabled when the VIC draws on the visible screen. This is done using raster interrupts. Since the RS232 routines are using the non maskable interrupt, this will destroy the timing needed to make the (partial) 2MHz mode work.

Regards

Uz

Sounds like a clever idea, even if it doesn't sound very ergonomic:-) Has
anyone tried something like this on the Commodore machines?

Isn't that known as horizontal interlace? I know at least one C64 demo
which does that (Just4Fun intro by TPF), but I believe it isn't unheard
of. Not that I would like to use any desktop system for a long while
with that kind of interlace.

Hmm... it could also be an OS and language problem. If the user is using the "4-byte" NOTE and POINT sectors of MyDOS 4.54 he might have problems with ATARI BASIC which he wouldn't have with the "3-byte" NOTE and POINT sectors of MyDOS 4.53 (more B.A.S.I.C. friendly, but less hard disk friendly).

The current snapshot does 40/80 columns on the C128. MagerValp did the initial
implementation followed by some tweaking done by me.

Well, you move a single byte or two. ;^)

Yeah, I would've mentioned this, too, but since it's a windowing system
(and there are icons, window widgets, and a 'desktop background'), this kind
of trick isn't very useful, unfortunately.

If only DLIs were 2-dimensional. (Like the 7800, if I'm not mistaken)

Itay Chamiel's "Ice-T" does it this way, too.

Would it be reasonable to 'switch the desktop into 80 column mode' temporarily
(e.g., while web browsing or something)?

BTW, it occurs to me, I think you can do the flicker trick with one char. set
and use horizontal scroll registers, rather than a second, shifted char. set
(saving 1024 bytes! Wooh!)

:)

MvB> Like I said; it was a flash of insanity ;)

I experimented a bit with setting the vector to move at a slow speed
to the right, then updating the intensity register while drawing.
While the line did change intensity, it didn't look anything like what
you could use to simulate a raster display. I don't know the hardware
well enough to say if it's possible or not, but at least my simple
test didn't work...

Yes, there's even an old 40-column terminal program for the VIC-20
that uses this technique (flicterm or something like that). It's
painful to use though :)

There isn't enough free ram in the C128 mode though, as bank 1 isn't
used by cc65 and the editor and kernal roms are banked in. With some
banking scheme similar to the Plus/4 target's that wouldn't be a
problem though. Also, the ram from $1300 onwards could be used.

You can either inline short routines in the C source with __asm__(),
or you can link asm routines and call them from the C code. The asm
routine will need to pick up the arguments from the stack, but that
can be sped up with __fastcall__ which puts the last arg in A/X. Check
out the library sources in the distro and all should come clear.

Well, if you could do it on a TI-99/4a emulator, I could then somehow get
it onto disk and cassette. I have a really nice 4a setup with the PEB,
disk drive, 32K card, RS232 card, and of course, a cassette deck. So, if
you can do the programming, I should be able to figure out how to do the
transfer (unless I'm off in Baghdad by then.) :p

Are there any special reasons for running an OS underneath Contiki?
Memory protection and drivers? If so, couldn't these be implemented in
Contiki instead?

>> Does the PDP-11 C compiler have a 8-bit datatype? If not, uIP will not

Good! There are systems (mostly DSPs) which don't have an 8-bit
datatype where char is 16 bits wide...

By installing the newest cc65 snapshot and by turning down some of the
configuration knobs in Contiki (turning off support for HTML forms,
the HTML tag, reducing the maximum URL length and lowering
the maximum amount of simultaneous links on screen), I was able to
compile Contiki with the web browser for the C128 in 80 column
mode. There are a few problems, and for some reason it is really
really slow, but it does work, with TCP/IP support and all. I uploaded
a screenshot to the ports page of the Contiki web site:

## 1808. Atari 8-bit ethernet?

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-12 21:09:03 UTC
From: Slor <slor@comcast.net>
Message-ID: <b4o7md$21qq0b$1@ID-164868.news.dfncis.de>

Hopefully this wasn't already discussed somewhere and I just missed it...
All this talk about the Contiki environment has me wondering if there is an
ethernet module available for the Atari 8-bits? If so, where might one
acquire such a beast?

Thanks

I'm not sure what the reasons of the display problems are, but I will try to
track it down (or at least make another entry in my TODO list about it:-). The
reason why output is so much slower is partially because accessing the VDC
*is* slower, and mostly because the ROM routines are used, which are a lot
more complex than writing directly to the screen.

Regards

For me this is the most exciting project I have heard about since
Novaterm 10 - which ended up unfinished :-(

I would be very thankful to use my C64, my Swiftlink and a modem for
internet access! I have to wait for PPP-support. Please, please keep
this project up!

Thank you very much!
Franz

It's not as easy as with the Plus/4 because the C128 library does a lot more ROM calls (you should know, since you're the one who did the 80 column mode:-). Among other things this would mean another wrapper around the single character output routine - which is quite slow yet.

Regards

Just wondering if Contiki will ignore files it can't deal with
or if things like flash, javascript etc will be problematic.
Does it display alternate text for embedded images?

Well, if there is a good C/C++ compiler for TMS9900 series processors like the one used in the TI-99/4A, that would be great. I would want to use decent tools for this. If I can make a CF2TI-CART Interface, hmmm... that might be interesting. Wait a minute, what about that IDE64, (just change the gender and a few traceline configuration and we have an interesting possibility). Just have to have the TI pinout. I do believe some people done things like that. I could get away with Assembler and convert the 6502 binary to TMS9900 binary but this will be a tedious job. It would be easier to go from the C/C++ source. Small mods "could" be made. Especially in GUI and video/audio hardware compensation. (PS: I don't think Contiki messes with sound at this time).

It occurred to me that Adam Dunkels wrote in comp.sys.cbm:
> Are there any special reasons for running an OS underneath Contiki?

Well, ease of use comes to mind :)

A bare -11 is a bitch, requiring you to enter programs manually using
a bunch of toggle switches on the console panel, and having a bunch of
lamps (Not LEDs!) as "display".

http://www.psych.usyd.edu.au/pdp-11/11_70.html

Later MicroPDPs (Officially "LSI-11" systems) use a serial equivalent of
this.

Furthermore, there are driver issues. the PDP11 isn't a single type of
computer, it's a whole range of more or less compatible devices..

It looks like as an alphanumerical display and not an GFX-screen like
Geos128 or the efforts megapatch and wheels, wich uses the 64kB GFX
RAM for colors?

Don't waste your time with wildstar, he's just a troll from c.s.c who
can't code. Besides, there isn't an ANSI C compiler for the TI is
there? If there is it's as simple as just compiling the source and
adding a small RS-232 driver.

But ultimately we'd want to add custom conio routines for text output
on the C128 as well. It shouldn't be too much work at all and perfor-
mance is almost as good as on the VIC if you're doing text, thanks to
things like auto-incrementing writes and block copies. No time right
now though.

Impressively fast porting. Contiki is indeed a paragon of portability.
The text appears to be in capital/shifted cases. As I recall (not
having ever been great at VDC programming) the VDC can support 512
characters in the character-set, allowing both upper an lower case
simultaneously. The 80col lib for the C compiler may not be allowing
you to set the case bit. In VIC-II you tell the chip you want the
screen to be in uppercase or lowercase. On VDC you tell the chip with
each character what case that char should be. Looks like it is always
being sent with the case bit set.

I'm definitely not the expert. Ullrich or Per are much more knowledgeable.

Alex

VDC can be faster a bit if you turn off colour (this is probably not good for
Contiki) or change DRAM refresh rate. More on that in one of the first
C=Hacking issues.

Hehehe, like we can't code a simple 6502 assembly. First off, when I came here - it has been a couple of years since I dealt with assembly. Now, I suppose to think you are some super holier than thou. FLI is great when you are trying to push a 4 bit chip to display color at a level of a 7/8 bit chip. Now, why worry about fairly CPU intense processes like that. If you can place a whole 16 bit color in a 1 x 1 tile aka Pixel then all you have to do is LDX the low byte value, STX it at a location and LDX the high byte a value and STX is at location + 1. Kind of like color RAM. If you plug a value in color RAM it will make the text the corresponding color. (If you are in text mode)

Now - there is a difference in demo coding where you are playing with "algorithms" a series of equations. Setting register values. I just don't like f***ing around with Vector rotation algorithms that includes polymorphic effects, shadow projection, ect.,ect. all at once. You don't need to do all that to make a f***ing kernel. What you need to do is make a multi-task manager that handles the manages the tasks and switch them at the proper times without crashing. This isn't exactly a simple task but a different kind of task to work with. Don't compare apples and oranges. They both maybe fruits but they grow on different trees.

I haven't coded all that much with a TI is years but if there was a C compiler - I don't give a f*** if its ANSI C or another kind of C. Now, don't over guess - there might be a C compiler and possibly an ANSI C compiler for it. People do support them too. Just like the speccys, apples, ataris, ect,ect.

It is just a little hard to find. The assembly code has been released.

|first C=Hacking issues.

I always wondered if there was some kind of an objective way of figuring
out how many cycles you can save in terms of response time by setting
the DRAM refresh register one way as opposed to another... Not everybody
waits for status to stabilize before squeezing a byte into the bottleneck.

As long as you set the brightness at regular intervals you should get
evenly sized pixels. That's the theory anyway :)

# 1835. Re: Load Binary file Syntax Dos 2.5 Question

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-14 00:02:24 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <k_8ca.4256$nJ5.383395@newsread2.prod.itd.earthlink.net>
Source record: 22598

At the 'Select or Return...' prompt, press "L", <Return>
then enter a file name preceded by drive designation if not D1:
like "MYGAME.EXE" or "2:MYAPP.COM" or "D2:ASM.BIN"
It will load to the intended address coded within the file
You may optionally add an "/N" to suppress execution if it is a load and go
file.
Some files require a "MEM.SAV" be present on the disk if they load into
memory used by the DUP.SYS menu itself around $1CFC to about $3500.
There is a 2.5 doc file on the Atari Tips & Tricks site.

> adding a small RS-232 driver.

No, there isn't an ANSI-C compiler for the TI, even a cross-compiler.
There WAS a TI-C development environment that compiled for the Geneve
TI-clone and was available as a cross-compiler for the PC, but no-one
seems to know what/where it is, availability, etc...
The best I am aware of and actually have is a version of small C,
which _isn't_ ANSI, and doesn't support alot of things. I wrote an
Unzip program in it back in '89, but had to do alot of inline
assembly.
_Everytime_ someone on the TI group asks about porting this or that
program (like they did with Contiki), I remind them that we need an
ANSI-C compiler, and then you never hear anything else...
Perhaps if I ever find a job in this currently cursed market, I can
finally settle down and start more programming - but my first duty now
is to my family, meaning I devote all my time to that. Even reading
these newsgroups makes me feel guilty! Writing code even more so (so
you probably won't see a minigame compo entry for the TI this
year!)...

> but I do recall it being surprisingly similar.

Qb was inspired by the sliding tile game where you have to reorder a
grid of tiles with one tile removed, by sliding tiles into the vacant
positions. Xagon ... dunno, it just came into my head one day. The
games were similar because we stole each others' ideas (and tools!)
during development.

Cheers
A

Hey, I am not the one who started the TI conversation. We were talking about
Contiki. I am not particularly interested in going on a long debate over
this. Hehehe, virtuoso - hmmm... that sounds familiar. Now, who is the one
that called me that. ;-)

## 1842. Atari800MacX version 1.3.0 released....

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-14 05:09:13 UTC
From: atarimac@yahoo.com
Message-ID: <f8e743fd.0303132109.3ad2c22a@posting.google.com>
Source record: 22605

The new version of the Atari800 port for Mac OSX has been released.
You can download from http://members.cox.net/atarimac

New Features/Bug Fixes (version 1.3):
Features Added/Changed:
* Added ANTIC/GTIA Cycle Exact code from Atari800 core emulator.
This adds compatability with several games and demos. See
Compatability page of program help for more detail.
* Added ability to save and load multiple Disk Sets from the Disk
Management window. (Also from the Fullscreen UI). See the Media page
of the program help for details.
* Ability to handle 4 USB Gamepads. This change will require
users of earlier versions to respecify their joystick emulations.
* Added x3 Scaling and x4 Scaling on Windowed Display, and added
the ability to lock Fullscreen display to 640x480 (on by default)
* Added Cartridge and Disk state information to State files. Now
when loading a saved state, the cartridge and disks present when the
state was saved will be mounted. The state file format has not
changed, but the disk/cartridge info was added to the end.
* Added Backquote (`) as break key, in addition to Pause/F15.
* Added Known Bugs page to Help pages.
* Added Hot Key (F7) for "Limit to Normal Speed"
* Added Emulator message window, which is used to display debug
and informational messages from the Emulator core. It can be found
under the Control menu.

Bugs Fixed:
* Fixed Break key/Interrupt bug from Atari800 core emulator
* Fixed bug where Gamepad Joystick would stick in one or two
directions, unless moved in the other direction. This bug would go
away after a few mintues, but was very annoying :). (But amazing easy
to fix...."I love it when a plan comes together" :)).
* Fixed bug with Boot Disk Images where only one or two images
could be specified without crashing the program.
* Fixed bug where Atari Inverse, Clr-Tab, Set-Tab, Insert-Char,
Insert-Line, Delete-Char, and Delete-Line keys were not recognized by
the emulator.
* Moved Mouse Grab key(F12 to F11), as it conflicted with Optical
Media Eject on non-Apple keyboards.
* Fixed BW/Color conversion bug in Pallette Formating code from
core emulator.

## 1843. Montezuma's Revenge question

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-14 05:14:24 UTC
From: satcom2@attbi.com
Message-ID: <82a18ff2.0303132114.3d25b377@posting.google.com>
Source record: 22606

Does anyone know which company was the first to release Montezuma's Revenge for Atari 8-bit computers? I remember a version by Utopia, where the guy had a pointier hat, and there was a big giant boss guy at the end of the game that I never passed. Then the Parker Bros. version with the flat hat and no boss. And now to totally make things confusing, I just got a hold of a version by BCI software. So did 3 different companies release this game for the Atari 8-bit? If anyone can shed light on the confusion it would be great. Thanks! -SaTcom2

I have it and I believe the source too.

Though this is a TI discussion and we should move the discussion. Yet, it is reasonable to discuss multiplatform elements very carefully. Since this would be for gathering ideas and information useful for moving Contiki onto a TI as well. This will be a thrilling but very easy to do once we have the TMS9900 mneumonic code. Keep in mind this will be easier then fighting a lockout chip on a Nintendo. (well.... except for use of a knife blade and cut the trace line that is in contact to pin 4 but it should be grounded)

# 1847. Atari 400 Troubleshooting

From: Damien Cymbal <d_cymbal@hotmail.com>
Message-ID: <e4lca.93375$qi4.54124@rwcrnsc54>
Source record: 22610

Hello All,

I'm looking for pointers on how to troubleshoot an apparent hardware problem with an Atari 400.

The machine runs fine for about 5-10 minutes and then will freeze up solid so I'm assuming that there is some sort of heat/temperature issue that is causing it, but I'd appreciate any tips on how I can drill down further to determine the exact cause.

Thanks much.

dc

Wasn't it Datamost or Datasoft that ACTUALLY released it, I know it
eventually ended up with Parker after a while but by then there had
been the unfinished beta all over the place..

There are _too_ many different variations on Clint Pulley's c99
compiler these days, but they are all small-c variants. I haven't seen
any that adds structures, for example, or support unsigned ints...
I, myself, worked last year on porting the c99 file I/O libraries and
the c formatted I/O libraries over to the SAMS c99 compiler last year.
SAMS being an extended memory system, was a little silly for having a
c99 compiler that had graphics but no file I/O nor the normal
printf/scanf family of functions.
But I have to support _this_ version, as it is the only version of a
c99 compiler to support the extended memory by allowing functions to
be placed in different memory pages, as segments.

There is a version of Montezuma's Revenge on the Sega Master System as well. Very similar, but some differences. Never did play either deep enough to notice many differences, but still a classic, well played game.

# 1853. Re: Load Binary file Syntax Dos 2.5 Question

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-14 18:45:17 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3E72233D.7940542B@students.uni-mainz.de>
Source record: 22616

Well
goto DOS/DUP, once there:
1) type L (for binary load)
2) press <RETURN> key
3) type Filename.EXT or Dx:filename.EXt
(where Dx is the drive number, like D1:, D2:, etc.;
Filename.Ext is the name of your file, must be upper case!)
4) press <RETURN> key

Now the program should load or a) you will get an error like BAD Load File (try loading from Basic instead), b) need MEM.SAV to load this file (rename file to Autorun.SYS or more likely the program overwrites DOS, thus use a Gamedos to load it), c) program/computer crashes (or you see the Atari Basic Ready prompt or you get an Error 12 at Line 0, etc. - just disable the built-in Basic by holding down the Option key on XL/XE computers at bootup-time; unplug the Basic cart on 400/800/1200 computers); etc. etc. just try some options... -andreas.

> of the other Z80 boxes out there???
>
> Might be beyond me, but still interesting...
>
I studied how the Z80 softcard works many years ago and I think the 6502
was halted while the Z80 was working. The Apple' 6502 would 'wake up'
to perform I/O and for short periods of time to refresh its registers
which were built like dynamic RAM (needs refresh or it loses addresses
for program counter and stack pointer!) In short, it was one processor
at a time, plus they shared the same RAM.

The memory map for the Z80 was all mixed up compared to the 6502 map to
re-create the memory map of a CP/M system.

CP/M wasn't offering much service: serial and disk I/O (through BDOS)
and a return-to-OS system call. Since CP/M offers I/O, I guess it
wouldn't be too difficult to make Contiki use them.

My first C programs were done under CP/M with BDS-C (that's stands for
Brain Damage Software). The BDS-C author made is compiler sources open
to public. All in Z80 assembler: amazing!

Bringing CP/M to the Internet age: what a mad concept! Just like
riding a donkey on the freeway :).

cheers!

Yves

Source record: 22626

I posted a note about color shift on my 130 XE a few weeks ago, and received a couple of suggestions (Thanks!). I ultimately found the correct "fix" for the problem. In my situation, the culprit was the enhanced cartridge port. I had cleaned the connectors on my Black Box (which plugs into the ECP) many times, but that really had no effect. This time, I went after the ECP with contact cleaner and pipe cleaners. Wow -- the dirt/oxide was significant. I then coated both the ECP and BB connectors with "Tweek" and the color has been stable ever since.

Well, I think he actually has a right to post crap, but not if it's hurting other and he clearly does. I think one should be able to post piss posts if you want, but not something that put someone else in a bad spot. At least have a good reason, like if Ben ripped him off or something, but then he should just say so, not put up this crap with fags and stuff. And lastly, be a man (or woman) and stand up for your opinions, not hide like a chicken shit!

Really freaky. ;) It was like 0000H->$1000, B000H->$D000,
E000H->$C000, F000H->$0000 or something like that.

> CP/M wasn't offering much service: serial and disk I/O (through BDOS)

***WOW*** !!! !!! !!!

I'm a little foncused. Exactly how and where do I download the working C=64, C=128, and CoCo versions? I'm using the real thing, no stinking emulators. Do I have to compile it my self? If so, where do I get the compiler?

By the way, sory if you've explained all that, but I'm afraid I'm a little dumb sometimes, especialy when I'm in a hurry, and I'm literaly accessing on borrowed time.

Exactly, it is a port of the ctk-conio theme, which is text based. For
the future, anything is possible, however :-) (All it takes it someone
to actually do the work ;-)

The URL where you can find either the already compiled binaries, or the
source code if you want it is given in the first post of this thread as:

http://dunkels.com/adam/contiki/

Unless Adam has moved it to another address it should still be there.

How much for M.U.L.E. ? If it's boxed and complete, that is ?

# 1877. Atari version of Contiki 1.0 web browser finished

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-16 14:54:39 UTC
From: Christian Groessler <cpg@aladdin.de>
Message-ID: <pan.2003.03.16.14.54.31.760395@aladdin.de>
Source record: 22640

Hi,

you can find it on
ftp://ftp.groessler.org/pub/chris/cc65/contiki/contiki-1.0.atr

It currently only supports the 850 serial interface.

Since it loads very low in memory, a special loader DOS is needed, and
it won't work from e.g. SpartaDOS or AtariDOS.

Some things of the C64 version are missing (e.g. frames support),
because the memory is still very tight.

On the ftp site there are bootable images and the sources/diffs for
Contiki 1.0 and the MyPicoDOS 3.0 loader.

Thanks to Adam Dunkels for the Contiki browser and network stack, and
to Matthias Reichl for MyPicoDOS.

regards,
chris

# 1878. New eBay auctions - Atari Monitor magazines, including V.RARE Issue ONE

Newsgroup: comp.sys.atari.8bit

Source record: 22641

Hello All,

I've just started new eBay auctions for issues of the UK's Atari Monitor magazine. This 80's magazine was a full colour glossy magazine published by one of the larger UK Atari user groups. I have split the collection into smaller batches of 2 and 3 magazines so shipping costs will not be too high for overseas bidders who only want a few. Issue ONE is available as a separate auction. This is VERY RARE and definately one for serious Atari collectors.

The link is below (this will split on to two lines, so please copy both lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangar

Unfortunately not :(. I programmed for CP/M with K&R C then switched to
various versions of Microsoft/ANSI C to do system programming under
MS-DOS, and so on with Windows, etc.

Do you have an Apple 2 and a PC Transporter? That would be a nice
target platform!

The idea of bringing Apple/CPM to the Internet keeps spinning in my
head. I think I'll try it, basically as an exercise in OS and network

programming. How about adding file support and a bare-bone FTP client? The Z80 has a nice architecture and so did CPM, with clean system call interface bouns. There's a 80 column display support too which is quite convenient for a text-based interface. I have to do an evaluation of the whole idea.

# 1880. Flamewars museum

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-16 17:24:05 UTC
From: stano2000@yahoo.com

Hi 8bit folks,

some of us are still young and our blood boils up when comes to good old flamewar discussions. Yes, everybody should know that your lovely [put your own 8 bit here] is far more better than their stupid, slow, buggy and ugly [put their horrible 8 bit here]. I was ZX Spectrum user for many years and maybe you'll be shocked when I tell you I must admit that Last Nija 2 on C64 was great and has unbelievable graphics, International Karate on Atari XL/XE was cool and isometric 3D games have fantastic and unique colourful graphics on Amstrad CPC. I'm not going to upset you when I tell you that some games like Cybernoid, or Renegade are much better on Speccy compared to other 8bit formats. I only think that some differences between our platforms made life more colourful and funny. I think that entire 8bit software scene was much more creative and really original in overall compared to todays often boring only megaprojects.

What I would like to do is to ask you for some cooperation. I'm going to preserve flamewar related screenshots, or articles on my web page. If you know some flamewar related software with great spicy graphics let me know please. Send my a copy or give me URL of such stuff please. I'll do some screenshots, and put them to the Flameware Gallery. In next 20 years we'll be still young enough to fight because our CPU, video chip...you know. But I think younger 32/64/128bit lamers will not understand us. That's why I'm collecting some visuals, some texts, to remember those old days and to show the essence of 8 bit computing.

I started with some screenshots already, most of them are of Spectrum provenience. Any other materials from your C64, Atari XL/XE or Amstrad CPC is welcome. Games, Demos or Flamewar chunks of code could be also related to Apple II, Amiga, Atari ST, or IBM PC. The only requirement for gallery publishing is to be plain 8bit software. Good ones will be grabbed and published soon. Maybe categorized too, if quantity allows this.

First samples are shown here:
http://emul8.xlabs.sk/flamewars/flame.html

Or here (8bit vs PC related):
http://emul8.xlabs.sk/flamewars/pc.html

Thank you in advance for your cooperation and understanding.

Keep the great 8bit spirit. And stay young forever with nice computers
from '80s.
Kind regards

Stanley

## 1881. Machine Language For Beginners book on the Web

The team at AtariArchives.org is pleased to announce that the full text of the best-selling book _Machine Language For Beginners_ by Richard Mansfield is now online at

http://www.atariarchives.org/mlb/

Published in 1983 by Compute! Books, this classic book shows BASIC programmers how to program in 6502 machine language. It includes examples and program code for Atari, Apple 2, PET/CBM, VIC-20, and Commodore 64 computers.

This is the 12th classic computing book available at AtariArchives.org. Like all books at the site, it has been made available by permission of the copyright holder.

Very cool; this was the book that I used to learn 6502 assembly. Though I
doubt I'll ever need to read it again, it's cool to see people put in this
much hard work to preserve items like this.

I looked at this great resource.
If I remember from looking at some other books,
there's no index or detailed Table of Contents.
I notice you're not supposed to copy the book off
the internet.
In this case, the Index is missing. The first thing
you want to do is look in the index. This book,
and others if I remember, make it hard to actually
use it. It is intended for online reading only I guess,
but even then, without the index, it would be hard
to find what you're looking for.
Kevin makes an enormous contribution here, as
with other online magazines and books for the
Atari 8-bit. I wonder if the absence of an index
is on purpose, or just something not deemed needed?
Russg

Source record: 22498

I take that back. I checked atariarchives.org,
specifically 'Mapping the Atari' and 'De Re Atari'
and they both have the index/table of contents.
I guess I get to feeling greedy... 'I WANT THIS'
and want to download all the files and have them
in my archive. This I think I did for 'Mapping', which
I'm not supposed to, maybe I didn't.
Ok, De Re, Mapping, ML for Beginners, The Atari
Assembler by the Inmans, and finally Leventhal's
'6502 Assembly Language Programming' constitute
my entire ML library, Uhm, well, the book that comes
with 'Assembler Editor' has a handy quick reference
to all the op codes in a table and the addressing modes
I refer to often.
I'm presently trying to write an assembler routine to
print characters on a GRAPHICS 7 screen. I have it
in BASIC, but it needs ml to speed it up. Inman's
book has the multiply two numbers and add two
bytes routines.
But I ramble.

Aloha,

First of all, you ARE the man.

I was very happy to see a first all-in-one product, which looks promising.

The only question is, will it support other languages, except English ?

(Espcially the right to left ones, like Hebrew, Thai and Arabic.)

If yes, this could be a MAJOR breakthrough.

Cheers.

The Godfather.

# 1890. who designed or invented the first emulator

I was wondering who or what came up with the whole Idea of
computer/console emulation

There are 2 schools of thought,

If we are talking about emulation both the hardware and the operating
enviroment and the ability to load in the software (in the form of the
host computers disk/media format) of the emulated machine then the
first fully fledged emulator that appeared was the Xformer (renamed
the ST Xformer) after the PC equiv. was released, despite the speed
and h/w limitations offered by the ST/fm/e it proved that this kind
of program was possible (I understand the last ever version for the
st-v2.55- only emulated about 60-75% of the atari h/w, although it
emulated the d/d hardware flawlessly) this was the first ever
commercially and PD released computer emulator (release 1987/8) there
was an added bonus this was the first emulator to receive backing and
endorsement from the manufacturer the s/w program was emulating (in
this case Atari)

The first hardware based emulqator released was the sam coupe (which
featured a built in spectrum emulator or mode) again this had the full
backing and support of the hardware manufacturer (sinclair/amstrad)

The only other s/w emulator to have received full endorsement and
backing from the h/w manufacturer was Win UAE (Which is officially
supported by Amiga inc. and Gateway 2000 respectively) and just incase
I forget the only other h/w emulator to have received full endorsement
and backing from the h/w manufacturer was Amstrad with the Amstrad
emailer which featured a built in spectrum emulator or mode) with
support by amstrad

The second school of though regarding which invented or designed the
first emulator follows

If you just take an emulator as being a program (s/w or firmware) that
emulates the operating environment of the emulated system and also
allows you to load in software (in the form of the host computers
disk/media format) of the emulated machine then you have to go back to
1982/3 When ATARI (Warners) released a software program to coincide
with the launch of the initial range of xl computers (none of which
were ever offically adapted to work on NON US NTSC tv/electrical
standards (only the later 6/800 xl's were adapted for use in non NTSC
markets) the program was called the XL translator wyhich was
essentially an O/S overlay for the host system and also allowed the
User to load in software from the previous atari computers (400/800)
into their xl systems, this translator program was essentially a very

basic or crude emulator

Anyone out there prepared to prove me wrong

carmel

That site only has the source code and 2 versions for use with
emulators. I tol you I'm not using an emulator. Where do I get the
version that will run on a real C=64 as soon as I download it?

You don't write software specifically for emulators... That's not an "emulator" version.. It's a C64 version than can run on an emulator..

I don't have a C64, but I'm assuming you just have to get the disk image onto a C64 disk and run it..

> was/is Star Raiders, in fact it's what made me buy an Atari 400 in the first
> place. The first time I saw it I was totally blown away.

My favorites on Atari XL/XE are:
Montezuma's Revenge
Star Raiders II
Bruce Lee
H.E.R.O.
Kennedy Approach
Eagle's Nest
Air Strike (I'm not so sure if it's not Air Strike II)
Another World (is this a real port or demo only? I'm amazed, it's so
nice.)
Arkanoid
Boulder Dash
Raid over Moscow
Who Dare's Wins II

Best of Atari 2600:
Pitfall!
Star Raiders I
Missile Command
River Raid

In terms of graphics International Karate is the great masterpiece on
Atari XL/XE IMHO. System 3 should made some clever tricks to put so
many colours simultaneously on screen in such resolution.

Kind regards

stanley

You bring up some great points but here is my take on the subject. The first hardware emulator I can recall is the Colecovision adapter to play Atari 2600 games which was released in August of 1982, the Sam Coupe wasn't released until sometime in 1988. I also know that a PET emulator was relased initially with the C64, it is mentioned up in this ancient thread from 1982:

http://groups.google.com/groups?selm=bnews.ihuxa.161&oe=UTF-8&output=gplain

I don't really agree with the Atari Transformer angle since the xl machines were advertised to be "backward compatible" with the 400/800 and the Transformer was more or less a fix than any type of emulator. Besides the PET emualtor for the 64, I recall the A64 package which was a C64 emulator for the Amiga released around 1990.

Cheers.

Hi Mathy,

It does but it won't shrink enough. Still truncates some of the text,
strange thing too that the XEP seems to use overscan and so did the Amiga so
I would have assumed the monitor would have supported overscan modes a bit
better than it does. I also have the Batteries Included 80 column card for
my C64 and it is a much better product than the XEP80 imho. :(

[snip]

Hi,

thanks for your comment. I'm planning to optimize all pages and test
them on the Bobby service:
http://bobby.watchfire.com/bobby/html/en/index.jsp
Later there will be download section added to soundtracks page. It
will be possible to download many standalone players for Amstrad CPC,
Atari XL/XE, C64 and Speccy music rips.

Anyway I'm considering some design changes because I've got some
recommendations from web designers and hints from some people, and
important hints from web checkers and validators (Lynx, Bobby check,
256 colour web palette, ST sound plugin and SID plugin features etc.).
I'm planning also some interaction like Search engine, Guestbook and
so on, but it needs some time and some experience :D

Kind regards

stanley

So this site is supposed to make everyone better?

The generation who used computers before the micros are a nice bunch of
people who don't seem to flame off other machines.

What's going to happen when this generation is older & crankier, there will
be more flames & life expectancy will be lower as a result.

Concerned,
Ross.

The XL Translator was really more of what we used to call a "software wedge." It didn't emulate anything. It merely wedged itself in with the OS ROM, which intercepted calls that were buggy in the XL ROM and instead used the appropriate calls as if the XL were a 400/800.

Computer emulation as a whole dates back even further than the original Atari 400/800 line. Just one look at Infocom should tell you that. Granted, the Z-machine wasn't a real computer, but the fact that they created a virtual machine to run on many different platforms to play all that great interactive fiction is proof enough for me that the concept of emulation is older than our beloved Ataris.

I may be mistaken, but I think Digital's (then Compaq's, now HP's) VMS operating system works with an emulation concept, too. Not sure how far back that OS goes, though.

For Sale ~ cleaning out my collection.......
Atari 8-Bit Games N.I.B. for the Collector
For the 400, 800, 600XL, 800XL, 65XE and 130E Series of computers.
The following are for sale:

Star Raiders
Defender
Galaxian
Centipede
Space Invaders
Super Breakout
Frogger
Pengo
Ms. Pac-Man
Pac-Man
Junge Hunt
Robotron: 2048
Moon Patrol
Pole Position
Tennis
Millipede
Rescue on Fractalus!
Nercromancer

To be sold as a set only....
These games have never been used.....
Serious enquiries only.....
Asking $270 CDN....
Buyer pays shipping or pickup in Kanata ON
Dave

Serious enquiries only ? Are YOU serious ?

You might try, but I doubt anybody will pay that for those games. Most are $1 to $5. Only game that has some value there is Rescue on Fractalus. I think you need to re-evaluate the price of those. Canadian dollars aint that low, is it ?

Well, well, good luck trying to get that price!

# 1909. ABBUC Programming Contest Website

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-17 21:47:27 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <b55fh4$25u3ve$1@ID-174234.news.dfncis.de>
Source record: 22522

Hi,

the central Website for the ABBUC Programming Contest is
http://www.strotmann.de/twiki/bin/view/APG/AbbucProgrammingContestEng

This is a Wiki Web Site. So new Information, especially Information about
programms that will take part in the contest, can put online without the
webmaster and without FTP or other upload tools. You need just your
browser. If you use the Wiki Text Formatting Rules
--> http://www.strotmann.de/twiki/bin/view/TWiki/TextFormattingRules
you don't even need to know HTML.

And because this website uses very clean HTML, it should also be browsable
with a text-mode browser like LYNX, Links, or the new contiki system from a
A8.

We like to invite every programmer who wnats to take part in the contest to
enter some information about his/her programm on this Website.

Best regards

Carsten Strotmann

:D How could you be so wrong. Don't you know that -=[MY]=-
F.L.A.M.E.W.A.R. <museum> is the best just because it's:
- biggest one placed on superfast fibrechannel SAN RAIDed storages
- fastest connected directly through Ebone backbone with geographic
clustered content ditributed on majority of net related satellites
- more flamy than any else, with such nice explosions like crash of
galaxies
- cover every and when I say every I mean every computer related
flamewar ever including Altair vs Apple I, Mosaic vs finger, Netscape
vs MSIE, Intel vs AMD, Cyrix vs UMC, Windoze vs Linux and Eniac vs
Enigma machines [!]

Ufff, such nasty flame :^)

I forgot to make one very important comment about this web browser:

I TOLD YOU SO!!!

Some people say they hate to say that. I don't, especialy considering how many peole on these newsgroups said it was impossible. How ridiculous. I knew it would happen.

Of course, even I'm supprised that it works on a VIC-20.

# 1912. Re: The Internet-enabled Contiki Desktop OS

Source record: 22526

A Friend told me about this Contiki thing for the Atari 8-bit and I'm excited - not this excited since finding the JPG viewer last year.

Though I wonder - Some developers should try to make it work with Atari 8-bits with extended memory (like the 130XE and RAMboXL's 256K banks). And even though the page info says it loads very low in Memory, it claims it wouldn't work with SpartaDOS. But I have SpartaDOS X and it uses No Low Memory practically - I have mine set up to use the last available extended RAMbo XL memory bank for its stuff. It uses little himem as well. I wonder if Contiki could be specially written for these systems, possibly using the extended memory banks for additional program code or a means to put extra data out there - certainly with SpartaDOS X, the RAMdisk that exists (the cart can be set up to not use certain banks but then that does reduce the RAMdisk space a bit) could be used as a temporary cache. Users who still have the MIO or CSS Black Box and their multimeg hard drives hooked to them could use a little support (using the HD to download images and stuff and put them there for whatever use later).

This looks promising as I would hope other support for other webpage content (like javascript at least) could be implemented. At least bring it up to almost the current version of WebTV.

Though I wonder - I have a 4800 baud Hayes modem. Will my ISP lemme drag the speed that far down? ^_^;;; I haven't even tried to find a 14.4K modem...

But then I also have a WinCE (HP Jornada 320LX) unit and I'd love to directly use that on the 850 interface, using the WinCE unit as a TCP/IP PPP stack or something... (I could stick the 56K modem in that and use the serial connection to the 850... Certainly would open up the possibility to using my Atari 8-bit to put files on the Jornada... though I've wanted to do that with my Diamond Mako/ Psion Revo for about a year...)

anywho, I'm looking to see about grabbing a copy of Contiki and see if SDX likes it. ^_^ Then seeing if my ISP doesn't mind 4800 baud...

Not really. The Translator disk was actually the OS from the 400/800. The XL/XE range had RAM under the ROM and you could bank the RAM in and ROM out. So the translator turns interrupts off, banks the RAM in and loads the 400/800 OS into memory. You are now running an 800 and games that used illegal entry points instead of the vectors would now work.

Message-ID: <J5yda.42056$eb.1041918@twister.austin.rr.com>
Source record: 22529

I'm just a little confused though, it claims to load a handler for the 850 interface serial port. How exactly do I connect to the internet through that? I don't think my ISP will like me trying to connect with my 300baud acoustic coupler 8-). Is this meant to work with something like APE? I could do that just using Chameleon term. I think it's a great effort and probably worth the time, it just seems a little too late to me now that not many ISP's offer dial up shell accounts- and the few that do rarely support 300/1200 bps connections.

Good! :-))

Sadily, there would have been so much more Peace & Harmony, if none of these users had crossed paths. :-(

Luckily, the Jupiter ACE users don't have to worry (they don't have a specific group towards it, so they don't have to put up with miserable postings!).

Ross.

# 1919. Happy Backup / Archiver

Newsgroup: comp.sys.atari.8bit

Message-ID: <dqkd7vgkbjp7r0l385n1ic7294sdle7rtj@4ax.com>
Source record: 22532

Any idea where I might find a copy of the Happy Back / Archiver manual? I've had a "B&C Happy 810" drive and the software for a number of years, but back when I bought it (used), it didn't come with the instruction manual, or any documentation. Granted, I can pretty much use the software without a manual, but it would be nice to have a copy just the same.

I've done some searching online, but haven't been able to find any Atari 8-bit web sites that mention the manual. I'd also be willing to pay for a copy if someone has one for sale. As far as the version number of the software I have, I can't recall the exact revision at the moment, but I believe it was the last version made for the 810 drive.

Thanks!

Hi,

> The XL Translator was really more of what we used to call a "software
> wedge." It didn't emulate anything. It merely wedged itself in with
> the OS ROM, which intercepted calls that were buggy in the XL ROM and
> instead used the appropriate calls as if the XL were a 400/800.

Not really. There is nothing "buggy" about ROM calls in the XL, at least nothing that broke games from working. Instead, most of these games were broken by using direct jump addresses into the ROM instead of using the documented ROM vectors. QS-Forth and QS-Forth compiled programs are a wonderful example of how bad software can be. Another popular reason for software crashes on the XL series is the shorter printer buffer in the XL ROM. Address 0x3fa used to be part of the printer buffer in the A800 and was, amongst the remaining buffer, frequently used as temporary storage for some programs. Unfortunately, in the XL ROMs this is a shadow register of the GTIA TRIG3 signal that indicates whether a cart got inserted. Even worse, the Os vertical blank compared the shadow register against TRIG3 and stopped program execution if the two were not found identical. Unfortunately, some software modified the shadow register as said, and hence locked out itself. (Bakterion! being one example) Strictly speaking, those programs are buggy as well; the area from 0x200 to 0x5ff is reserved for Os ROM purposes and not for application software. Not that anyone cared these days...

Concerning the translator disks: This is mainly an Atari800 Os that could be loaded into the RAM under the Os ROM of the AtariXL. Absolutely nothing fancy.

> Computer emulation as a whole dates back even further than the
> original Atari 400/800 line. Just one look at Infocom should tell you
> that. Granted, the Z-machine wasn't a real computer, but the fact

> the concept of emulation is older than our beloved Ataris.

You'll find emulator concepts even in the 60's. Look into volume I of D. Knuth's "The Art of Programming" and you'll find that Knuth mentions some emulation software there.

Greetings,
Thomas

I have one of those. Think it needed DOS, but not quite sure. I'll try to
find it and make an ATR of it. I have a disk with a few loaders on.

# 1924. Re: The Internet-enabled Contiki Desktop OS

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-18 12:00:08 UTC
From: MrShoujo@webtv.net
Message-ID: <7196-3E771858-194@storefull-2334.public.lawson.webtv.net>
Source record: 22542

Just thought of something after thinking about it -

The claim that the Atari 8-bit has less free available memory than the C64 is actually a little untrue when considering programs like Turbo Basic XL and SpartaDOS 3.2d, and models like the 800XL and the XE series.

Turbo BASIC XL and SpartaDOS 3.2d HIDE themselves (or part of themselves anyway) by bankswitching the RAM addressed where the system chips and the OS ROMs are! This is also the main reason why both Turbo BASIC XL and SpartaDOS 3.2d don't work together - but Turbo BASIC XL does work with SpartaDOS X!

I guess there's about 10K or more RAM that can be used to hide part of Contiki under the OS Roms just like how Turbo BASIC XL does it! Has anyone suggested this? Forget trying to make it work on all versions of the Atari 8-bit with one version of the program. An XL/XE version would be best for those with those systems. ^_- Have it hide part of itself like Turbo BASIC XL does and you'll have plenty of room for regular DOS loading, RS232 handler, etc - without worrying how low it has to load into RAM. ^_^

I would love to see this technique implemented in that one JPG viewer I got as a future revision. ^_^

Of course, if you REALLY can go this route - make Contiki a spiffy huge bankswitched Cartridge and you have all of the main RAM to work with. I'd love a nice cartridge based web browser working with SpartaDOS X. ^_^ SDX must be a 64K cart on its own. ^_^

Just thought of something after thinking about it -

The claim that the Atari 8-bit has less free available memory than the C64 is actually a little untrue when considering programs like Turbo Basic XL and SpartaDOS 3.2d, and models like the 800XL and the XE series.

Turbo BASIC XL and SpartaDOS 3.2d HIDE themselves (or part of themselves anyway) by bankswitching the RAM addressed where the system chips and the OS ROMs are! This is also the main reason why both Turbo BASIC XL and SpartaDOS 3.2d don't work together - but Turbo BASIC XL does work with SpartaDOS X!

I guess there's about 10K or more RAM that can be used to hide part of Contiki under the OS Roms just like how Turbo BASIC XL does it! Has anyone suggested this? Forget trying to make it work on all versions of the Atari 8-bit with one version of the program. An XL/XE version would be best for those with those systems. ^_- Have it hide part of itself like Turbo BASIC XL does and you'll have plenty of room for regular DOS loading, RS232 handler, etc - without worrying how low it has to load into RAM. ^_^

I would love to see this technique implemented in that one JPG viewer I got as a future revision. ^_^

Of course, if you REALLY can go this route - make Contiki a spiffy huge bankswitched Cartridge and you have all of the main RAM to work with. I'd love a nice cartridge based web browser working with SpartaDOS X. ^_^ SDX must be a 64K cart on its own. ^_^

Later!

"Read this very carefully, I shall type this only once nyo!"
"There would be little point in typing it twice nyo!!" - 'Allo 'Allo nyo

Is it possible to use a dead 800XL to fix/replace
the bad keyboard on the 1200XL?

Atariarchives.org has received permission to put Tricky Tutorials (a series of programming tutorials for the Atari 8-bit) online, but we don't have a complete set of them. I'd like to buy or borrow these little pamphlets (and the disks that accompany them) so we can scan them and put the online.

If you have any TT materials, please contact me at www.savetz.com/contact/.
(If you reply to this message, take care to remove the spam filtering.)

Thanks
Kevin

## 1933. Anyone program something that uses 2600 driving controllers?

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-18 17:07:07 UTC
From: dnsdebro@netzero.net
Message-ID: <adf9eca9.0303180907.7b23ffe5@posting.google.com>
Source record: 22546

I haven't seen any games/programs that use the driving controller. I know it's kind of a rare controller. I was wondering if anyone knew of an 8-bit program that used it. Or if they may have done it for fun.

I went the other way and put a 1200XL keyboard on an 800XL, but there was extensive modification. The 800XL has the KB decoder chips on the mother board while the 1200XL has them integrated into the keyboard.

There is no plans for adding support for "right to left" languages,
nor for languages that require a more sophisticated font encoding
(such as Chinese). There might be a Spanish translation available of
the next version, however.

Cheers,

Wet string? Luxury! I have to access it by listening to a bloke with a
loudhailer at the top of a ladder shouting out the bits, with repeater
'shouters' every half mile or so.

I lie awake at night dreaming of wet string!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Shouters? Man, if only I had shouters! I have to enlist the help of
a local Indian who has the uncanny ability to listen to the ground and
pick out the bits.

I wring my hands in anticipation of the possibility of having
shouters!

An Indian? You lucky, lucky bast. I have to chase the bits after
they've already passed and attempt to hand re-assemble them.

Only the rich folk have Indians round here.

Does anybody knows of any plans
on including 8bit scans/manuals/programs/etc
at AtariAge?

It would be a great feature!

Regards

## 1948. Programming NEW games?

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-19 16:07:43 UTC
From: jhillman2000@yahoo.com
Message-ID: <e76f4b60.0303190807.5daa3b9a@posting.google.com>
Source record: 22461

I once owned an Atari 800 when I was a kid, learned BASIC and started writing some assembly language routines to be called from BASIC. I wrote a game called SpaceHunter which used the combination of both languages. I'm currently looking for the source code that I know I had printed out somewhere in my house. Anyway, I'm curious to know if there is anyone out there creating/writing new Atari 800 computer games using BASIC or ML?

Sitting in the spaceship after you landed, and not knowing if the
knocking outside was one of your guys or an alien... that was the
scariest moment in computer gaming ever.

Nothing produced since then has ever come close

I definitely agree...
But wait, it wasn't the knocking, but rather the figure approaching your ship.
Or did the aliens also knock the door in the higher levels?

I GOT A NEW GAME!
Uhm. Right now, I'm working on a ml routine
to put in the BASIC game to print characters to
a GRAPHICS 7 screen. I have the game working,
but it is a bit slow, even compiled.
There's a print to GRAPHICS screen routine in
'Your Atari Computer' for two color modes (6 and 8
I think are two color). I modified it to print to
the 4 color G7 screen, expanding the bit map of
characters from ROM to two bits per pixel instead
of one bit per pixel.
I ain't rambling now, ML is a bit challenging.

I have been working on a Boxworld clone (Boxworld might be a clone for all I know, but that's the PC game I started out to make an 8-bit version of). I asked for help on graphics and music, but didn't get any help. A few answered, but then I never heard from them again. Moved in October and haven't been able to get all my stuff out yet, but I expect to try to finish it with shite graphics and stolen music.

Also been thinking about a Shining Force type of RPG game, but that takes more effort than I can put into it I think.

Guess I'm lucky! There is an Indian village just on the other side of the
mountain. The bottleneck is sending the bits over the mountain by mule.
There, they are sent their way by smoke signal.

You aren't kididng. A computer gaming reviewer did a "10 Scariest Games"
article some months ago, and I think ROF should have been included just
for that part alone.

I might remember wrong, but I swear that on either Behind Jaggi Lines or
Rescue On Fractalus, the aliens' helmet was a slightly different color
than the friendlies' helmet. Does anyone else remember this?

I don't have the details, but there was something about the console switches (start, reset, select and option,) not the keyboard itself, that required a resistor as a fix. I hope this jogs somebody's memory.

Take care.

Alan

From what I've heard they do plan on adding 8-bit computer coverage to Atariage, and are working on it. However, it is a very large project and I guess is taking a long time to get together!

Yeah that sounds right, anybody? Very happy to have a working 130XE again:-)
Alternate reality here we come.

Yes, we will be adding an 8-bit section to AtariAge in the near future. :)

> Was/is there a difference between the "driving controller" and the paddle?

Yes, the driving controller offers 360 degree movement. Also the
driving controller is read through the joystick port on the 2600 vs.
the "paddle port". I don't know about the 8-bit but I assume it would
be read the same.

Take a look at http://www.atariage.com/controller_page.html?SystemID=2600&ControllerID=3
to see it.

One went round and round, the other just turned right/left and had a limit on how far it could go.

My vote is for 4K for the reasons you listed above. Right now I am
thinking about attempting a 4k version of Lode Runner or Realms of
Impossiblity game or maybe even a RPG. 4K could be just as challenging
but even more fun in my opinion.

It works in a similar fashion as an ST mouse, IIRC...

Source record: 22489

Hi

I dug out my old Atari User mags, because I remember performing this fix myself many years ago.

Hope this is the one you mean.

Cheers
Geoff

---
From Atari User, July 1988

"Cure that keyboard glitch.

Can you please help me with a problem I have with my 130XE computer? My Option key has stopped working and I can't figure out what to do.
Do you know of a quick cure to my predicament or will I have to send it to someone to repair it?
Richard Head, Westminster, London.

Unfortunately the 130XE keyboard can suffer from two small problems that luckily, rarely raise their ugly heads. The first is that the metal tracks that connect the keys to the main PCB tend to oxidise. This stops them making a circuit when a key is pressed.
The second glitch is the cause behind the oxidiation problem. The function keys are fed with their own 5v power supply and it's this that causes the build up of oxide on the track.
It may be possible for you to fix both of these yourself but the job of doing so is quite involved.
However, for the stout of heart, here goes: Remove the lid from the micro - the four screws on the underside hold it in place - and then gently unplug the keyboard membrane from the connector on the main board.
Unscrew the main PCB and twist open the metal tags so that you can remove the casing. Now you will have to locate resistor R95.
You'll find it in the bottom right corner of the board where the ? and Shift keys would be, but don't worry, it's labelled underneath. Now carefully unsolder it.
If this is replaced by a 1k (0.25W) resistor the track oxidising problem will be solved.
If this doesn't effect a cure immediately you may have to take the keyboard to bits and clean the tracks - a can of PCB Cleaner (code 51-11108) from Cirkit will do the trick.
Be very careful not to take off the tracks altogether, as they are very easily damaged.
This is not an easy task to undertake and quite possibly a little too much

for a novice. However, a service engineer familiar with Atari equipment
will be able to do the job for you."

APX didn't buy the copyright to the programs, so we're getting permission from
the original authors. Tracking them down can be tricky.

The 1st, from my memory is the Macro/Asm disk. The "Asm Disk" does not have macro support.

The 2nd, Not everyone forgets...I published an article on how to patch 2.5 so the sector count is right.
Also, It will work in any 8 bit Atari with 64K of ram, but nothing else that uses the ram can be used. But really great for
Dandy Dungeon with its 26 levels.

# 1980. XF551 Power LED Install

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-21 04:55:08 UTC
From: Tim <tjlazer@mail.com>
Message-ID: <v7l6pb3rscbr3e@corp.supernews.com>
Source record: 22493

Can someone guide me to the install of a LED for Power on this drive? I have an article that says how to do it but doesn't include the pic to show where to solder the wire on the PCB.

Here is the article:

http://www.umich.edu/~archive/atari/8bit/Unverified/Cislib_b/pwrled.txt

I have a question on the following sections:

8: Locate the jumper wire marked "V" on the front edge of the interface printed circuit board. (See diagram #2) Solder one of the 14 inch wires to it.
Solder the other end of this wire to the ANODE end (long leg) of the LED.

9: Locate the jumper wire marked "G" on the front edge of the interface printed circuit board and solder one leg of the resistor to it (See diagram #2). Solder one of the 14 inch wires to the other leg of the resistor. Press the resistor flat against the PCB. Solder the other end of this wire to the CATHODE end (short leg) of the LED.

I need to know where the V and G wires are.

Thanks
Tim

Yeah! How many of you almost had to change your underwear the first time the alien popped up in your face and started hammering on your windshield???

I was so shocked the first time that I couldn't even remember to fry him with my force field! Of course, the music helped to scare the you-know-what outta me, too. :)

Was that the version with the extra character buffer for 128 basic?

Brian

Tim,

The 'V' is just any ground. But the actual 'v' on the pcb is forward about
1" (inch) from center of pcb. It is a bare wire. The 'G' is far right
center of pcb. I believe this higher voltage so a resistor is used to step
down the voltage so that the led will shine and not go poof and let out the
magic smoke.

```
power > _o___sio____sio_____
| |
| Board G|
| ^ |
| V |
----------------|---------
```

Regards and good luck

Sounds good Chris. Do expect later versions to have color and take
advantage of the extra memory certain 8-bit Atari's have?

Probably not. The Atari has a hard time displaying different colors in
graphics 0 mode.

> advantage of the extra memory certain 8-bit Atari's have?

This extra memory is banked at a very unfortunate address ($4000-$7fff).
This is inside the guts of the contiki program.

regards,
chris

# 1986. Re: [--- ASM, Ramdisk ---]

Newsgroup: comp.sys.atari.8bit

Source record: 22399

Hmmm,
I do not know this "nothing enhancement", but my DOS 2.5 disk contains
an XL-Ramdisk driver from Antic or Analog (written by someone from the
Netherlands). You name it Ramdisk.COM and it will install the XL-Ramdisk
as drive 5 (D5:) with 108 free sectors. This is great when using
DJ-Packer, which only works with 2 drives. Alas, this XL-Ramdisk driver
merely works with DOS 2.5 and (almost) no other DOS. Looks, like the
author used some illegal/direct jumps into this DOS... -Andreas.

P.S.: Nope, I don`t count the XL-Ramdisk as a (real) Ramdisk. It does
not use or provide extended RAM - it just uses RAM under the OS ROM
(max. 14kbytes)...

Well,
I looked at the memory usage of Contiki, its approx. 1000-A500, so it
does not work with most DOS versions. What about relocating Contiki to
2000-B500 or so ?!? Then most DOS versions would work with it. Or is the
area B000-BFFF already in use ?!? (Afaik the screen memory starts at
BBFF or BCFF, so there should be some space left).
Just a thought - Andreas.

P.S.: Maybe one can create 2 different versions: one that uses RAM under
the OS ROM (C000-CFFF and D800-FFFF, afaik 14kbytes can be use here) and
a second one that uses extended RAM (XE-type rambanks/ramdisks)...

nah, if there were to be 2 categories, one should be quite cramped and the other more sensible, like the first one with 512b and 2K categories. Between 2k and 4k games, you'll basically have the same game with a couple of more features or graphics. However, if it were 1k or 512b again, those games would be in a totally different class than the 4k, which is how I think it should be for voting categories.

Does anyonw know on what leg of the LED goes the 150 Ohm resistor? Positive or Ground? My guess is Pos. I plan on using a regular molex connector with the two wires connected to mount the LED. Easier install and no modifying of the drive!

Thanks
Tim

Hmm... it seems to me that going for 4K to "allow you to expand a bit" is going against the whole idea of the competition. As I see it, the effort involved in using 4K to its full potential is pretty much the same as writing a full Codemasters-quality[1] 64K game, so we might as well forget the size limits and just have an 8-bit game writing competition. Which wouldn't be such a bad idea, providing there were enough people willing to support it.

[1] Make of that analogy what you will.

Tim,
Eventho, the directions say to solder the other end of this wire to the the
resistor to the Cathode (short leg) the resistor is just to reduce voltage
through the LED. Either side of the LED should work to reduce voltage
through. But in this #9 reference resistor goes to 'G' and the other end to
(short leg) of the LED.

How about two categories - 1K classic and unlimited wild, where the
scoring in the latter class is based on handicap:

For every kilobyte beyond 4K (4096 bytes) used, one minus point is
"added" to the voting. This means a 64K entry would start at -60 points
but should probably make that up if enough people vote and the entry
itself is good enough to take advantage of all 64K. The question is
whether traditional crunchers should be allowed or not.

PC can copy the image from Atari disk drive thur 1050toPC cable. 1050 can read only the single and enhanced density disks but of course, 1050 can not read the double density disk. So IBM 360K disk drive can use 180K or 360K disk. Can IBM read Atari 180K or 360K disks by MSDOS program? If it can do that, how do I get that? Anyone know?

What about a dual GTIA mode? Or additional graphics modes/PM
graphics? Software for it wouldn't work on an original 8-bit, but
it would be fun to play around with.

Source record: 22411

I probably don't know of some PC utilities to read/write
180k Atari disks, but Marslett's 'myutil' or 'util' will
read/write 180k MyDOS formatted disks, with fair
reliability. There is a PC program called 'Anadisk'
that can dump Atari 180k disks to a file and then
there's a 'deanna' PC util to convert the dump to
a Atari file.
The above are not 100% reliable and can get into
errors and 'myutil' isn't the most easy to figure out.
Russ

## 1999. Re: lacking of reading double density disk...

Charles Marslett's 'myutil' or 'util' will allow read/write
of MyDOS formatted 180k disks by the PC.
'Anadisk' will read A8 sectors to a file, and 'deanna'
will convert the resulting file to an A8 type file, I think,
never used 'deanna'.
I take it you have some 180k disks you want to read,
but have no Dbl dens a8 drive.
Russ

Good news, I went to Rat Shack and got a 12VDC Red LED with built in
Resistor and hooked it up to a Molex connector with two stray wires
and it works great! Nice clean install.

Thanks for the all help.

Tim

Go here:
http://www.horus.com/~hias/atari/
and get Hias's utility for reading MyDos 180K disks; it runs out of a Dos
window and does best when the disk was formatted on the PC - but it can get
most files from many diskettes.

Ken here:
http://home.columbus.rr.com/ksiders/atari.htm
has a W9x utility to create and manage the image files used by SIO2PC.

Of course they should be allowed. If they aren't, where are you going to
draw the line between "traditional crunchers", crunchers that are modified
to suit that particular program, internal data unpacking routines that are
called multiple times during the program's execution, and table precalc
routines?

# 2003. eBay auctions for 'Atari Monitor' mags soon to expire

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-22 14:48:43 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1048344609.67618.0@ersa.uk.clara.net>
Source record: 22416

Hello All,

My eBay auctions for issues of the UK's Atari Monitor magazine have less than a day to run, so if you want to bid on any you'll need to be quick! This 80's magazine was a well regarded full colour glossy magazine, and well worth a look if you haven't seen these before. I have split the collection into smaller batches of 2 and 3 magazines so shipping costs will not be too high for overseas bidders who only want a few. Issue ONE is available as a separate auction. This is VERY RARE and definately one for serious Atari collectors.

I also have a few items of software for auction too.

The link is below (this will split on to two lines, so please copy both lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangarraghty

>
> > No, I don't think so. But a convincing business case could probably be
> > made for a retro technology magazine.
>
> Maybe but it would take a huge leap of faith for an investor.

I had about 850 subscribers to 8BIT when I closed it and refunded all
outstanding subs.

That list was built up by word of mouth and frequent mentions on the
newsgroups, plus I did my best to cultivate reciprocal relationships with
the existing single-format magazines, to which my magazine was no threat.

I would see selling a quarterly print run of, say, 3000-5000 as being
relatively easy to achieve for a mail-order glossy, despite the fact that
there is a significant proportion of the on-line community who would resent
paying *anything* for it, on principle, and expect the whole magazine to be
available free on-line.

Not sure how the economics would stack up now, but I wouldn't want to get
involved with Sale Or Return (or High Street newsagents in general, in
fact!)

The reason for that is that if more than 50% of your cover price is
immediately going in distribution costs and potential write-offs, plus you
have the production costs to cover, you would need a HUGE amount of regular
paid advertising to make the thing at all viable.

And I am not convinced that a huge amount of paid advertising support is
still available from suppliers of retro computing stuff.

I took very little money for advertising in 8BIT, but still ran it at a
profit for over three years, so it can be done. But it would take someone as
tight as me to do it, and I'm not going to.

:-)

I know that this is an 8-bit newsgroup (I read it because I still use and love my 800XL) but I knew someone that had a similar problem on a 1040ST many aeons ago... there was a cold-solder joint that had a crack so miniscule that he couldn't find it for a while and as the machine would heat up, the joint would expand and so would the crack, causing the machine to freeze when hot (does that make sense?).

Anyway, he said that he had to reflow several of the old solder joints and everything was back to normal.

I didn't see this myself, just heard it from a friend... I hope it might help to narrow things down a bit for you.

Brain,

I run ZX Digest, and I have no where near as many people subscribing as you had, but there
again I only concentrate on Spectrum stuff 8-> I agree with you that producting costs are high
and I also agree with you about the mentality of some people wanting everything for free. I'm
quite fortunate in that my subscribers just about cover the costs of producing ZX Digest (and
with a few pennies, litrally, to spare)!

Wanting somehing for free is all very good and well but very damaging to the community and I
think would put a lot of people off from producing anything worth publishing. I think that there
are some great people in the ZX community and there again I think there are some complete
knobs. Oh well, that;s my moan over and done with!

Regards

Andrew Ryals - Editor ZX Digest

Yes, I would! If I could choose any spesification, I at least would want 3
1/2" floppy, HD and the Amy chip (I might remember this incorrectly, what I
mean is the XE Music machine sound chip that never was released)

And if possible, added graphics modes like 320*200 with 256 colors!

I think all should better try to help the existing magazines and not run so many new projects that appear and then disappear. Brian, altought you paid out all subscribers, you still did disappoint them with stopping your magazine. Who is telling us that you won't stop this time again after you are out of mood?

Look at my magazine, I run it now for 9 years!!!!
http://www.sintech-shop.de/home/spectrum-user-club.html

I am sure there is no better chance for a Spectrum-User to get a magazine in which he can trust that it will not disappear.

Regards

Thomas

So true (and not just in the ZX community) and so beautifully expressed.

:-))

Mmmm - if your "me me me" newsgroup postings are anything to go by, I
don't think I could cope with a whole magazine full of it.

Most of the people reading this newsgroup probably would, but that would
be at most a few hundred, and there is no way to profitably produce new
eight-bit computers for so few customers.

Hmm, that leads me to an interesting idea... couldn't virtual platform-type program be written that would be an updated Atari-type computer? I know there would be a lot more to it as a new OS would also have to be developed but I think it all could be done in software and run on a modern PC. But I guess when you really think about it, the Amiga was the next generation Atari 8-bit as visualized by Jay Miner, just not produced by Atari perhaps but developed by the same engineers that developed the Atari8.

One thing I don't want is a PC with emulator. Emulators doesn't stand up the the real thing, cause none of them runs my demos. Does that mean an Atari 8-bit is more powerful than a 1GHz PC ?

## 2025. ML routine

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-23 22:13:02 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <v7sc8gmgn8ole8@corp.supernews.com>
Source record: 22438

I wrote a ml routine to replace one I have in BASIC
to print characters to a graphics 7 screen.
It is too big, about 380 bytes. The problem there
is that I wanted to put the ml routine in a BASIC
string, I like to do that and let BASIC handle the
memory. My asm routine isn't relocatable, because
I had to use a JMP instead of a BNE/BEQ. BNEs
can only go 128 bytes up or down. In addition,
I had a multiply routine to JSR to, that also requires
a non-relocatable address. The JSR can be replace
by putting the multiply in-line the two times I call it.
Other than trying to make more efficient code, I'll have
to either make the main loop in BASIC or use the
poke 106(peek(106)-2) and reserve a specific
memory area. Anybody got some suggestions for
reserving memory? Mapping says I'd have to
use a minimum of 4K using the 106. At this point
I only have about 7k left, I'd rather do something
using less memory.

## 2026. 130xe extra ram

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-23 23:42:20 UTC
From: Mark Bedingfield <mark@nospamplease.computercom.com.au>
Message-ID: <wDrfa.3241$Ov1.21753@news-server.bigpond.net.au>
Source record: 22439

Hi, guys, is there a way to remove the emmu from the 130XE and only run 64k of ram. I have a second 130XE, which I suspect that either freddy or the emmu is at fault. I would like to test this theory by disabling the upper 64k. All it gets is a black screen, I have replaced all the other chips, antic etc. So logically all that is left is these 2 chips.

Thanks

Mark

You could try the following:

Pull out (or desolder) the MMU CO25953, and connect the following
pins of the MMU socket:

pin 1 (A14 in) to pin 12 (FA14 out)
pin 2 (A15 in) to pin 13 (FA15 out)
pin 6 (CAS input) to pin 11 (CAS MAIN output)
pin 10 (CAS BANK output) to +5v (pin 16)

To use the extended RAM bank instead of the main bank, swap pins
10 and 11.

I don't know if this will work, but you could give it a try.

so long,

Hias

As a cheat you can do multiple Branches on down to the final
Jump location you wanted to get to. But I don't know how many
it would take for your code string, or if there are convenient
places to add the extra Branch instructions. Basic is not my
strong suit, sorry no advise there.

Funny... I don't see a "blue screen of death" on my PC, and I never have
to reboot it. Oh, maybe because I use Linux on this PC, not windows.

You Know those 'Vtech' pre school/ early school machines?

They have a GUI interface, a works style package, regular printer ports etc. The top of the range ones plug into TVs/old monitors, have a text based browser/Pop email etc. As well as word processors, spread sheets and educational programs.

I'm led to belive that they are based on Apple ][ 's to a degree

If one of those was based on the Atari chiset, with a 3.5 inch floppy drive, but retained the SIO and Cartridge port. I would be VERY tempted. Especialy if it had a switchable boot up for Atari and the other mode.

That sort of machine could be a viable comercial idea as well. Catching both the early school and the retro market.

well, atari basic does boot up with a blue screen and it does lock up
from time to time so maybe that's where MicroSoft got the idea of the
blue screen of death. :o)

...another idea stolen by MicroSoft! ;-)

## 2044. Disable Basic on 600xl or 800xl

Newsgroup: comp.sys.atari.8bit

Is there a simple way to disable basic on a 600xl or 800xl? I realize
that
holding option is one method, but is there a quick hardware method for
doing this? Any solder jump points, etc?

My 800XL does have Freddy (it's 800 XLF model).

And again: Freddy has _nothing_ to do with extended memory, see my pages
for more info. http://www2.asw.cz/~kubecj/achfredd.htm

Schematics for that model, and all others could be found on Jerzy's
Sobola site (http://republika.pl/jsobola/)

Yes, there is a simple solution. All you need is a dual pole switch
with neutral position. This way you can select between:
- Basic always on
- Basic always off
- Basic controlled by PIA (standard mode)

Lift pin 11 of the PIA (PB1) and make the following connections:

center pin of the switch goes to pin 11 of the PIA socket
left pin of the switch goes to pin 11 of the PIA and
right pin of the switch goes to ground.

If the switch is in the "right" position, the left pin (PIA PB1)
is connected to the PB1 line of the Atari, and the Atari works
as usual.

If the switch is in the neutral "middle" position, the PB1 line
is not connected to anything, and the pull-up resistor (R85 in
the 800XL) ties the line to +5V (Basic is OFF).

If the switch is in the "left" position, the right pin (ground)
is connected to the PB1 line and Basic is always on.

Another solution (if you just want to switch between Basic off
and normal operation) is to place a standard switch (on/off)
between pin 11 of the PIA and pin 11 of the socket.

so long,

Hias

Source record: 22310

Hi, Russ;
Are page 6 and the cassette buffer in use? Between them you have about 387
fixed location bytes available.

Can you make it relocatable with a double branch like:
BNE STEP1
code continues up to 120 bytes
CLV ;configure for branch around
BVC SKIP ;go around intermediate stepping stone
STEP1 BNE FINAL ;go to actual destination
SKIP go on with flow of code
Overflow flag is rarely used and will not affect others in your logic plus
you only reach STEP1 from that original branch. This is very doable for a
single long branch or two and difficulty increases with more.

Another possibility is a small jump table in page 6 or bottom of the page 1
stack. Whenever you USR(ADR(ML$)) the address of ML$ will be in $D4-5 so you
could start ML$ with:
START *=$4000
LDA $D4
CLC
ADC (DESTN-START)&$FF ;lo byte
STA $100
LDA $D5
ADC (DESTN-START)/256 ;hi byte
STA $101
PLA ;your original code continues
The stack rarely gets that low and your assembler computes the offsets so
simply replace JMP DESTN with JMP($0100); just remember to include the $4C
when you construct a JSR $0102. Your table can also go in the $480-5FF range
since it is initialized with each call avoiding damage by floating point use
and string input to that area.

> BBFF or BCFF, so there should be some space left).
> Just a thought - Andreas.

The contiki exe file contains data from $10B0 to $A527. But the program
uses memory up to $B9F2. The area from $A527 to $B9F2 is the so-called
"bss" area which contains uninitialized data (e.g. communication buffers).
This still doesn't account for the cc65 runtime stack usage, which grows
from $BC1F on downwards, so there is really not much space left.

regards,
chris

## 2051. Graphic Master

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-25 05:23:43 UTC
From: Courtney Goodin <cgoodin@primenet.com>
Message-ID: <zJRfa.228705$sf5.143433@rwcrnsc52.ops.asp.att.net>
Source record: 22314

I wrote a graphics editor that was distributed by Datasoft in the Early Eighties called Graphic Master.
It was a graphics Mode 7 and Mode 8 Editor that allowed drawing with the Joystick, cut, copy and paste. and Allowed you to load and save your creations. It was written in a Hybrid of Basic and Machine language.
I have the Original Disks and am thinking about releasing them to the web if anyone is interested. I would need to get a cable made to create the Disk Files. Don't know if it will run on the Emulator because it uses some memory areas not used by DOS and some under the Basic. Has anyone on this forum (a). ever heard of this program and (b) ever created an ATR file from it's disk?

I also wrote the first Color Printer Drivers for the Atari 8 bit machines. It was Called "Color Print" and used a standard Epson MX80 or NEC dot matrix Printer to print in Color using multple passes with colored Carbon Paper. This program helped convince Epson that there was a market for Color Printers that used colored Ribbons.

It has been a long time since I looked at that code so I am a little rusty on what I did 20 years ago. I spent many nights of obsessed crunching of code to allow more features to be added and ended up sticking relocatable ML code wherever I could find a few bytes that weren't being used by the OS.

When a RAM is dead (even when it's in the upper 64kb area) your atari will never startup.

Even when you release any memory managment chips. When your mem is on socket (I guess not...) you should remove the upper memory bank (in the 8 * 1 bit version this is the right column of 8 mem chips; on the 2 * 4bit version there are 4 memchips, the 2 most below are the upper memory bank)

With the mmu etc. installed the atari is booting now like a 64kb compy.

Btw. A blackscreen sounds more like a bad OS to me. Problems with ram chips on my atari's most of time result in a red screen... but perhaps this is on my computer....

Marius

p.s. 800xl With freddy is a little rare. I have about 20 800xl and only ONE of them is with Freddy.

I agree. However I use an emulator that emulates an 8-bit disk
drive. (800xldj). The program runs on an Atari ST. Now I can have
my 8-bit programs on my ST hard drive and run them on my 130XE
using a SIO2PC cable. This way I can save my precious 8-bit disks.

That is another story. I bought APE a while ago and that I have no problems using. Cause it does emulate the drive perfectly, as far as I've used it. But, the ANTIC, POKEY and other chips inside the Atari, is not too well emulated on a PC. All my demos use all of the available time in the Vertical Blank Interrupt and all of them crashes. So, the PC can't handle the same amount of data during the VBI as the real thing can.

Possible but not easy. There was a hack a while back where some guys built an 8048 derivitive controller to 8 bit IBM PC buss. They put an old 8 bit ethernet card on it and got it working. Eventually the got it interfaced to just an ethernet chipset.

I'd imagine since people have used IBM style cards for things like Herc graphic cards it could be done with an Atari 8 bit.

You can just make your own Ethernet adapter like the c64 by getting a
embedded ethernet controller.

Look at: http://www.dunkels.com/adam/tfe/

The contiki desktop and uip do support it. I have tryed to make one but due
lack of time right now, I am not be able to finish it.

Maybe someone else can give it a try. The schematic is also free for
download and simple. I was thinking of making it cartridge based at address
$D5xx instead of $DExx of the C64.

# 2062. Atari 800 vs. XE130

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-25 21:41:29 UTC
From: puritan_2076@yahoo.com
Message-ID: <ae64f04a.0303251341.139f896b@posting.google.com>
Source record: 22325

Ok, I've decided I want an Atari computer. I don't need one, I just want one. The trouble is, I can't decide wich one. It will be either the 800 or the XE130. Is there any real difference bettween the two? If not, I prefer the more old-fasioned looking 800, and, of course, it has 2 extra "joystick" I/O ports.

I've heard the XE130 is faster (1.79mhz instead of 1.1mhz). Is this true? I also read that the XF551, which I will use either way, can work at 38.4k bps. Will it go that fast on an 800?

Does the XE130 really have an RGB port?

What plugs in to the XE130 expantion port?

Do both computers access extra memory by bank switching the second 16k, or does the XE130 do something different?

What does the XE130 have that the 800 doesn't?

# 2063. Re: Atari 800 vs. XE130

The 130XE has 128k of ram. The upper 64k is bank switched in 16k chunks. The 130XE also has rev c basic. the 800 is 48k of ram and has basic on cart I think? They are both the same speed as far as I know. The 130XE is the better machine. None of the 8 bits have rgb ports. Only chroma-luma and composite.

Have you looked at the Lantronix UDS-10 serial to ethernet adapter?
Check out www.lantronix.com. I use one on my TI-99/4A. I use it via
Windows 98 Internet Connection Sharing to connect to the internet,
using the Hayes modem command set extension to enter IP addresses, and
it can be connected to from the PC via a port # of your choice...

Anyway, with that, I can send/receive email or even grab a web page,
read/respond to newsgroup servers...

I've got mine connected through a hub to two PCs, one providing the
internet connection...

I thought all of those used undersized lcd's. I might be interested in
playing with one if if it had a mass storage device and basic. Where
can I get some info on the ones that use a tv?

Both are same speed and work alike with any drive.

> Does the XE130 really have an RGB port?

Neither has RGB; both have composite video and chroma-luminence.

> What plugs in to the XE130 expantion port?

Cartridges and parallel bus devices with Extended Cart Port such as hard
drives.

> Do both computers access extra memory by bank switching the second
> 16k, or does the XE130 do something different?

800 does NO banking unless memory upgraded. 800 has 3 memory slots
configurable from 8K to 48K stock; 1088K is largest mod I have seen
described.

> What does the XE130 have that the 800 doesn't?

128K RAM, parallel bus access, built-in Basic language, slight OS
differences.

> What does the XE130 have that the 800 doesn't? <

So far not mentioned, the XL/XE series will run quite a bit more software than
the 800.
You can run a "translator" on the XL/XE so it can run most old 800 software;
the reverse is not true.

## 2068. Component Video

I know what I'm writing about this is a little 'stupid' ... but If you want
to get yourself such a great atari ... why not buying both: 800 and 130xe...

The 800 looks really fantastic: it's BIG and strong... but as written before
by others: it doesn't run that much (new) software... and the new software
is really cool.

The 130xe looks NEW... 10 years ago I showed my 130xe to a real ST user. I
told him this XE was the new version of the atari ST. Like all computers,
the 130xe was the smaller version of the ST. HE BELIEVED ME!!!!! What a fun.
And better: he bought an atari 130xe :-) XE still looks very good, and no
one thinks: phew what is that an outdated computer.

Btw. I love the 800XL (that is the atari between the 800 and 130xe) most.

Marius

Weirdo. :o)

Go for the 800 if you have the money as long as it's a GTIA model. The clearest display I've ever seen on an Atari was on an 800, no vertical banding whatsoever.

the 130 XE runs the most software, And with a translator disk, can run
almost all Atari 8-bit stuff.
If I had to have only one atari, it would be a 130XE

The 800XL would be my next choice. That really is retro cool styling and a
nice change from pale grey thats so everywhere.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Message-ID: <y_gga.15764$LH3.542991@news1.east.cox.net>
Source record: 22338

Indus GT disk drive can increase the speed up by using Indus Synchome program in DOS XL. How can XF551 increase to 38.4Kbps? Using DOS XL or get DOS XE included XF551 Synchome program? Anyone know???

Hon Tseng

# 2076. Re: Atari XF551 read IBM 360K disk ????

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-26 12:40:34 UTC
From: Alan Sharkis <asharkis@optonline.net>
Message-ID: <6dhga.10408$ZC6.4299537@news4.srv.hcvlny.cv.net>
Source record: 22339

Hello Hon Tseng,

The short answer is, "No." There are several issues that would preclude the reading of IBM disks in an Atari XF551.

First of all, an IBM DSDD disk would be rare today, anyway. The 5 1/4" IBM disk would probably be high density, which the Atari XF551 couldn't handle.

Second, an Atari DSDD disk and an IBM DSDD, assuming you could find one, are laid out differently. An IBM floppy writes in clusters with each cluster sharing side A and side B. An Atari DSDD writes all of side A and then all of side B.

Third, IBM and Atari have different byte orders (MSB and LSB.)

Finally, the Atari uses something called a VTOC, which is different from the IBM FAT, and this also affects the way that sectors are linked.

There may be software solutions, but I haven't run across them.

> So, the PC can't handle the same
> amount of data during the VBI as the real thing can.

While I agree that current emulators do not 100% emulate the real thing which will cause some software not to work but this is not a fault of the PC, but rather the emulation software itself. In place of the words "PC" in your last post, should be using the words "EMULATOR", that is would be a much more accurate statement. Not to take a shot at my wonderful A8, but I haven't seen it running ANY PC software.. correct timing or not....

# 2079. Re: Sorcery BBS - 707 area code, Vacaville CA mid 80's

Well,
the XF551 cannot read IBM format directly. But there are external
programs available that let it read IBM format. There is also a program
for the Happy 1050 which lets it read 180k IBM format. But you are
right, it is hard to find 5,25" IBM disks these days, that are formatted
with 360k or 180k... -andreas.

P.S.: The Hyper-XF by Stefan Dorndorf (Germany) also has a mode to read
720k (3,5") IBM or ST disks, but alas the software is missing...

# 2084. Suggestion for an Atari presentation-program file-format called SLIDE

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-26 18:36:22 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <b5srme$2cu31m$1@ID-174234.news.dfncis.de>
Source record: 22347

Suggestion for an Atari presentation-program file-format called SLIDE

english translation by Andreas Magenheimer

Version 1.1, March/10th/2003
see also Article in the ABBUC Web
http://www.atari-portal.net/modules.php?name=News&file=article&sid=29

Whenever I am preparing a presentation for an Atari fair, like the ABBUC JHV (1) or Schreiersgruen (2), it annoys me to use a PC system and an application like Star Office or, even worse, M$ PowerPoint for the presentation. This should be possible with the Atari as well. Alas, up to date I haven`t really found a flexible presentation program for the A8. That`s why I made some thoughts about an Atari presentation format. This presentation format is independant of any implementation, e.g. it is possible that the presentation files can be read or shown by different presentation programs. For the creation of these presentation files one may also use a different program...

General Format:

The presentation files should be saved as pure ASCII / ATASCII files. Thus, it is possible to create these files with almost any text-editor (Compyshop-Text-Editor, Antic Writer, Analog`s T-Edit, Speedscript, Textpro, Action! Editor, Atari Writer, etc.) or with a special (external) presentation-creation-program. Pure text files can be read or written from any Atari programming language and exchanged easily between computers. Each line of the presentation file contains a statement which defines a) the contents or b) the style of the presentation.

Statements:

Each line of the presentation file starts with a four (4) character wide statment, followed by a double colon (:) and the appropriate arguments for the statement. The statement ends at EOL (155, $9B).

Example:
Text: Welcome to Atari World 2084

Style-statements are active from the line they are defined, until a) they are re-defined or b) the end of the presentation.

Content-Statements, SLIDE Version 1.0:

VERS: version number, arguments: a number between 1 and 255, defines the SLIDE version. Presentation programs should ignore unknown statements, the version statement should be set at the beginning of the file.

TEXT: text, arguments: up to 40 characters. This statement prints on-screen text from the next line, while using all previous style-statements.

TITL: title, arguments: up to 20 characters, describe the title of the actual page.

PICT: picture, arguments: filename of a picture in uncompressed 7680 Bytes format. This picture will be shown instantly, if a common graphics screen (7,8,9,15) is active.

KOAL: picture in Koala/Micro-illustrator format, arguments: filename of a picture in compressed koala-format. This picture will be shown instantly if an graphics mode is active. It depens on the implementation if all compression options of the Koala-Format are supported.

TRAN: transition, arguments: filename of the transition-effect (see also paragraph about transition-effects).

REMK: remark, arguments: text with up to 80 characters. This statement is to comment the presentation.

Style-Statements, SLIDE-Version 1.0:

SIZE: text-size, arguments: number between 1 (normal/small) and 3 (big/large). The displaying-technique is left to the implementation (by displaylist-changes, fonts, graphic-text, char.-graphics, etc.).

ALGN: alignment, arguments: right, left, center, block. Alignment of the following/forthcoming text.

TCOL: textcolor, argument: color-value of the Atari palette of colors between 0 and 255.

BCOL: background-color, argument: color-value of the Atari palette of colors between 0 and 255.

EFCT: effect, arguments: ml-programs for page 6. The ML-program creates an effect while showing the page (text and/or graphic). The program should be a normal Atari DOS *.COM file, which loads into page 6 and initializes via a jump to 1536/$600. The ML-program should return to the main program by a keypress or via the joystick button/trigger. The program must be loadable from Basic (e.g. via the OPEN command), therefore it should process the values on the stack given by Basic. This statement should also be useable to play music.

BLIN: blend-in, argument: --. Call the blend-in routine at memory-location $603.

BLOT: blend-out, argument: --. Call the blend-out routine at memory location $0600.

WAIT: wait, argument: 0-255. This statement stops the presentation for 0-255 seconds.

PAUS: pause, argument:--. This statement stops the presentation and waits for a keypress or the fire button/trigger of Joystick number one.

SCRL: scroll, argument: 0-255. This statement shows the following/forthcoming text-statement as a horizontal scoller. The argument 0-255 sets the speed of the scroller / scrolling (0 = fast, 255 = very slow).

GRAP: graphics, argument: valid atari grahics mode. Chooses the Atari graphics mode

FONT: font, argument: filename of an Atari font (1024 bytes). This font will be loaded and activated.

Transitions:

The statement TRAN loads a ML-program into page 6 (1536, $0600). This program creates a transition between two slides. The program has two init-adresses:
1. $0600 / 1536 blend-out (fade-out)
2. $0603 / 1539 blend-in (fade-in)
The presentation-program loads the transition-effect. Therefore one should make proof, if the program for the effect is still in memory to avoid any unnescessary loading process. The statement BLOT calls the transition-effect and the blend-out-vector. At the end of the blend-out-effect (fade-out-effect) the screen should be switched to black, by switching off the Antic DMA. The transition-effect program gives the program execution back to the calling program (the main program).

The presentation program now sets up the new page. This will not be shown, since Antic DMA is still off. The statement BLIN calls the transition-effect blend-in-vector. The blend-in-effect (fade-in-effect) should first activate the Antic DMA and then show the blend-in-effect. The blend-in and blend-out routines should also be called from Atari Basic, e.g. the routines must take care of the values put on the stack by Basic.

If the presentation-program is written/coded in ML or via a Compiler (CC65, Action!, Quick), one should simulate the Basic call-conventions.

And it was meant to be a joke, I know a PC can do more than the Atari's, but one thing I am serious about is that the PC is "soul less" (if that's a word) and the Atari's has soul! And getting the Atari to run PC software, well, it's must be hard to code all the bugs of Windows into the Atari, it would need to be heavily upgraded to contain all the blue screens, hang ups and stuff like that!

Take Atarian care

Does the XF551 really do 38.4k?

> > Does the XE130 really have an RGB port?

Does the chroma-luma (a.k.a. "S-video") use the same pin-out as the
C=64? If so, that will make cables easyer to find.

> > What plugs in to the XE130 expantion port?

Hi Ben,

Could you tell me what this can do?

Can you connect to a web-site with this device from your 8-bit atari?
Can you telnet to a pc from your atari and using a terminal program like
bobterm by typing 'telnet ip-address:port' ???

I am interested tell me more, couldn't find this info on the web-site...

> Does the XF551 really do 38.4k?

Do not have one; but speed is a function of the drive rather than 800 vs
130XE.

> Does the chroma-luma (a.k.a. "S-video") use the same pin-out as the
> C=64? If so, that will make cables easier to find.

Possibly - don't know the 64; I believe cables are similar. XE & 800 video
Pinouts are on Thunderdome:
http://www7.brinkster.com/atari/

> Wow! I didn't know there *were* hard drives. What other paralel bus
> devices?

ICD made the Multi-IO interface with a SCSI hard drive connector. Bob Puff
still makes the Black Box with MIO features plus additional like floppy
board option; see Mathy's page for more:
http://www-users.rwth-aachen.de/mathy.van_nisselroy/

> What about ram expantions?

The MIO and the Black Box both contain some RAM normally used for ramdisk or
printer buffers. Atari Corp planned a 1090 PBI module that only saw a few
prototypes. Direct accessible ram mods are not usually PBI connected.

# 2089. Sweet 16 Interpreter ATARI Sourcecode

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-26 22:16:22 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <b5t8iv$2cdeu6$1@ID-174234.news.dfncis.de>
Source record: 22352

Hello,

I ported the Sweet 16 Interpreter from the APPLE II ROM (done by Steve Wozniak) to the ATARI. You find a disk image and sources for BIBO-Assembler and Mac/65 at http://www.strotmann.de/twiki/bin/view/APG/AsmTips

Sweet 16 (do not confuse with the 65816 Ugrade with the same name) is a software assembler extension. It gives you a kind of 16 x 16 Bit registers and new opcodes for a simulated 6502 16 BIT CPU. The binary code is very lean, and the original sources done by Steve Wozniak are an example for tricky good 6502 programming.

---

This was the first time I used Mac/65 for a project (Vers 1.01 Cart), and I got a lot of "Phase Error 13" I cannot find the cause. Can anyone give me a hint what is wrong with my Mac/65 source?

Have fun!

Carsten Strotmann

What you want is an Atari 800 with the Rambo Chip! I had that. That was awesome, I think it upgraded memory on the computer, I forget. If somone can explain the Rambo chip, that would be awesome (maybe give a link to it). I also had 4 Atari double desisty floppy drives, two of them were happy drives, there was a guy in the silicon valley who sold a chips that you could install in the drives that would defeat copy protection. Or you could buy them from him. They were called Happy Drives. I had (and still have) a 300 baud MPP modem that plugged into the cartridge port!

I have my Epson FX-80 line feed printer still too. I remember people would send messages to the Sysop in control characters so they could send my printer on a printing frenzy.

Source record: 22355

actually, I believe that if Atari had good management (what a joke) that
they would probably be producing something similar to the X-box or the
Playstations that we currently have today.

Atari was very good on its simplicity, even a moron could 'usually' operate
it. Often, you just put the disk/disc/cartridge into the drive/slot/hole
and turned it on.

Imagine a machine as simple as a playstation (put it in and turn it on) with
the sound, graphics, and programmability of one of the complicated computers
we are using now. I imagine it would have internet accessibility as simple
as 'WebTV (but with better graphics), graphics better than a Macintosh, and
3-D surround sound.

Atari went down because the good management left and a bunch of morons moved
in and made some really piss poor management decisions. They brought down a
great company and should be thoroughly horsewhipped.

> on the OS?
>

Basically, the UDS-10 is a serial-to-ethernet converter, allowing you
to use those programs you already have that do serial communication to
access your network or the internet, with the proper support (like in
my case, I use Win98 internet connection sharing).
I can telnet to my TI from any PC on my network using telnet
192.168.0.2:10001, or I can use a terminal program on my TI to connect
to the internet, once I resolve the DNS name (there is no name
resolution).
I have macros setup with those places I 'visit' using the Hayes
protocol support provided in the UDS-10. Then a simple ATDT<IP
ADDR>/PORT will connect me.
With this setup, I could sent/receive emails, get a web page (not real
useful on a terminal program, usually), or read/reply to newsgroups
(given a news server)...

Hello Ben,

thank you for this usefull tips. The UDS-10 really makes it simple to connect to the internet once you have a serial adapter on you 8bit. It should be easy to adapt existing internet software (like the contiki desktop) to work with this device. The UDS-10 is not cheap (155 Euro here in germany), but it make the software part of an TCP/IP connection really easy and small.

Regards

Carsten

Most Do

I have seen 1 that uses a TV.

It the size and style of an ST. As a machine for early school age kids its
seems to me 'more like it'. It packed a 'works' style package in a 16 colour
GUI interface (i assume OS/GUI/Software held on rom). In built floppy dive,
Had ports for Colour Printers etc. I understand its not taken off too well
as most kids have hand me down 486's/Pentiums running works (there are a lot
about). Quick searches for pictures seem to suggest its discontinued

I reckon they may have held onto the Amiga Project as well, and we would
proberbly have a simple to use PPC based games machine now for sure, and
Maybe, just maybe, a PPC based alternative to the Mac, but without the usual
mac aggro.

But thats just dreaming.

Its a regular 5 pin DIN layout

I use a regular 5pin Din to 4 RCA jacks Audio lead. Seems fine despite the
cable alchemy from there on ;)

## 2100. Atari XE/XL red screen and not booting

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-27 16:05:20 UTC
From: Dub <dubaloo@yahoo.com>
Message-ID: <xlFga.154$qi3.3@newsfep3-gui.server.ntli.net>
Source record: 22363

Hi

I have an Atari xegs (pal) and when I power it up all I get is a dark red almost brown screen, I have seen this fault also on the 800xl. Has anyone else come across this problem before and managed to solve it?

I have replaced the ram but no luck. I have read somewhere that it may be the PSU, but I have checked this on a good machine and it is fine.

Anthony.

## 2101. interfacing standard atari joysticks to pc game port ?

Hmm could be but my experiences with the XEGS are that both the RAM and ROM
go defective I repaired atleast 4 systems with the same error... already...

Had no defective cpu until now...

Check the system if the RAM get's hot this indicates bad ram there are 2 ram
chips 4464 in there on the left side of the board... near the keyboard
connector...

Hello,

does anybody have the technical manuals for the INDUS GT Drive, like the ROM Source code or the "INDUS GT technical user notes"? Had anyone sourcecode of the synchromesh drivers?

I would like to play around with the Indus.

Best regards

Carsten Strotmann

There is already _some_ discussion at:

http://groups.yahoo.com/group/atari_ethercart

Although interest has fallen off lately.

I have outlined a way to connect the embedded ethernet controller to the atari
in this message:

http://groups.yahoo.com/group/atari_ethercart/message/12

However, I haven't had the time to wire it up.

We would need someone to write the driver for it, but maybe Adam Dunkels
already has this taken care of...just need to point to the Atari Addresses for
the controller.

Regards,
Chris Martin

Yes it is possible :)

The way I did it can be found at this web site:
<http://random64.emuhq.com/doc1/Joy2600-PC_eng.shtml>. It uses a game
controller to interface your joystick to and requires no parts other
than a switch if you want to use it for both a real Atari computer and
a PC. I did not include the switch in the circuit because I do not
plan to use the joystick for a real Atari computer, just for the pc.
There is also information here for interfacing paddle controllers to
the game port, but I haven't tried that yet.

Another method can be found at the following web site:
<http://www.epanorama.net/documents/joystick/pc_circuits.html#atari_pc_converter>
it requires more parts and building a circuit board.

I finally got a chance to look at your source and it needs some more
pound signs (#)?

1510 LDA >SET

evaluates on first pass differently than it does on second pass,
thus the phase error. On first pass, SET is a two byte address,
on second, its a single byte label. This shifts the whole deal
off by one byte, and that's where the 'phase' part comes in.

1510 LDA # >SET

is good to go, but I don't know if the result is what you really
want, I didn't look any farther than fixing phase error with this
line, but did notice that you had a whole table of similar non-
pound signed low byte, high byte stuff going on. You'll have to
figure out if it works OK as is with just the fix above or not,
but at least you know where the trouble is. I don't think
I've ever used a non-pound signed low, high byte symbol with
mac/65, but then I didn't know you could do without it either.
So I learned something too, that's a fair trade in my book.

Hi,

> is it possible (and how do i do it) to interface a standard atari
> joystick through the pc game port for use with atari emulator ?

Yes, and Atari++ supports this. (And I'm using it). For the kind of
"interface" Atari++ supports it requires :

1) A 9 pin sub-D "male" connector for the joystick.
2) A 12 pin sub-D "male" connector for the PC (huh, I hope this is right,
please check)
3) 6 22K resistors and wire
4) soldering iron

No active components are required, and the above parts are worth only a few
cents. Connect the joystick output lines to the four trigger lines of
the PC joystick, connect the "up down" and "left right" potentiometer inputs
by two 22K resistors in series (forming a 44K resistor, basically) with +5V.
Solder two 22K resistors in series to the trigger output of the joystick,
and connect the end of these two resistors with the middle point between
the other two 22K connecting "left right" pot with +5V. Connect ground to
ground. Then adjust the movements in Atari++ with your wiring and off you go.

Ok, I guess I should include schematics for this in the next release of
Atari++ which will be ready next week anyhow.

Greetings,
Thomas

Thanks for the replies,

I know the RAM is ok, I took out the ram and tried it in a 600xl upgraded to 64k, I would try the ROM next, but I have no replacement, would an xl Rom work to get it running? obviously without the missile command game, if not I can get someone to burn an eprom but what sort would I need?

Regards
Anthony

Hi,

thank you for the tips. This must be the problem. I need the high-byte of
the page where the SET-Lable resides, so I was missing the pound sign. I
will be at home on sunday and test this out, I will post a follow up to
tell you if this works. Thanks for helping me

The way it was described to me back then was that it didn't load the
entire 800 ROM image, just the functions that needed to be altered to
run the older software. I've never heard before that it loaded the
entire 800 ROM into RAM. That's why I was thinking "wedge." I used
to write software for the 800 that redirected ROM functions to do
other cool stuff (sadly, just to impress my friends, not to make
money). I was assuming that's how the translator worked.

Never had an XL, just an 800 and a 130XE, but a friend of mine had
one. He always had problems with Rev. B BASIC (didn't everyone who
had it?), and almost always had to use the translator. In our teenage
opinions in the 1980s, not being 100% backward compatible was being
"buggy."

You're totally right, of course. It was the software's fault to use
inappropriate ROM jumps. I remember vividly how bad Bacterion was on
the XL. I think my friend managed to make a boot disk with the
translator autoloading before Bacterion because it was such a problem.

Rev. B BASIC, however, WAS buggy, especially in terms of the inflated
file size every time you saved a program. The workaround was to LIST
the file to disk, but those of us who were habitual SAVEers were
annoyed by this change. My memory of XL being "buggy" has more to do
with Rev. B being in ROM than with the actual OS.

Rev. C BASIC was a welcome addition to many XL users' cartridge
libraries, I'm sure. That's my revision of choice for my 800, and
luckily the revision in the 130XE ROM.

Exactly. I used the Z-machine as an example because most everyone here would know what I was talking about. I have a vague memory of reading an article that mentioned earlier emulators, but I didn't know for sure what the timeframe was. Thanks for the reference.

Hello Winston,

I have a website with infos about ATARI 8bit FORTH Systems
http://www.strotmann.de/twiki/bin/view/APG/LangForth

There are two FORTH Systems (to my knowledge) that work from DOS, ES-
FORTH and the new X-FORTH.

Feel free to write me an email if you need additional information on
FORTH Systems.

Best regards

Carsten Strotmann

>
<snip>

I think this is one subject that would just be to hard to prove, given that the definition of what truly is an emulator isn't set in concrete.
My first computer was a TI-99 (the 99/4 came out in 1979). It has within its ROM an interpreter, call the GPL interpreter. Basically, it 'emulates' a byte-oriented, stack-based processor that doesn't even exist. The syntax isn't even close to the TMS99xx processor line, and it appears to have been written as a 'layer' between the application programmer and the machine to make development easier. The TMS99xx line doesn't have a stack, is word-oriented, and the 99/4 has several different 'memories' (RAM/ROM, VDP, GROM) that have to be addressed differently (GPL's layer of abstraction removes these differences). Too bad that the implementations of GPL assemblers created by others (other than TI) actually makes programming in GPL harder than in 9900 assembly!

I remember dabbling with it in the '80s as it came with some clip art of chemistry paraphenalia. Still have the manual around, but not sure where the disk is now. Never tried an ATR transfer as I remembered it being copy protected.

That was a bit of very impressive programming and the only place DataSoft put the author's name was on the splash screen and one image of that opening display in the booklet.

I'm back.
Ron has some suggestions, some sort of indirection.
I do have other routines using page 6.
And I'm using most available $CB-$D1. I didn't
know $D4-$D5 holds the ADR(ML$), or you say
I put it there? I don't understand the ADC (DEST-START)&#FF, dind't know
ASMED would do
that sort of stuff.
The BVC idea I sorta thought of doing multiple
branches to reach up the code.
I think I have one more page 0 location to do indirect
JMP and I might do that.
Thanks

Yeah, Datasoft wasn't much on giving credit to it's program creators. But since I really wasn't a Datasoft employee, ( I had written the program independently and just licensed it to them for distribution) they couldn't do much about the splash screen. It also was part of the copy protection. If you changed the splash screen the program would not run. I thought it was a clever way of preventing someone else from taking credit for the coding...

Maybe the chip inside the Ballblazer cartridge on the Atari 7800. I don't think the 2600 has this chip, pretty sure it is another one.

And Atari 5200, that might use the same chip.

Source record: 22392

Hi Russ;

Basic puts the USR( ) destination in $D4-5 as a consequence of doing FP math
to evaluate the first argument.

Yes, Asmed will do simple math on parameters; not certain if it uses the
parentheses grouping or just L-->R expansion.

The BVC would need only 3 steps in 384 byte code and both forward and back
code can be in them:

```
CMP ARGUMENT
BNE LATER_ONE
...
CLV
BVC AROUND
LATER_ONE BNE LATER_TWO
GOING_BACK BMI EARLIER
AROUND LDA CODE...
```

Btw, indirect JMP( ) uses a 2-byte argument and does not need zero page.

Message-ID: <v8fb50np39gee2@corp.supernews.com>
Source record: 22393

Hi, Ron, everbody.
Ok, indirect jump doesn't need page 0.
I understand that better than the multiple branches.
All I have to do is pass adr ML$ with the usr call
and PLA HI, STA some $6xx, PLA LO, STA.
and then ADC the offset to my loop beginning.
I have ml code scribbled on yellow sheets of paper.
And I have written in asmeditor and asmed it ok.
Not the JMP ($6xx) code yet, just the adds and
multiplies and the STAs to screen memory and
reads from the ROM char set, that get poked.
It's a fairly fun game for the non-joystick jockey, just
a simple dice game.
Thanks

## 2131. Bill Kendrick Gem Drop Question

Is it "Gem Drop X"? If so, that's mine. [*]
If not, then, well, it's someone else's game by the same name.

[*] Shortly after writing Gem Drop in Action! for the Atari, I ported it to
C for Unix with X-Window, and called it 'Gem Drop X'. Eventually, I
replaced the Unix/X-Window code with SDL, which allows it to run under
Unix, Windows, Mac, etc.

Hmm, okay, thanks... I'll keep checking into it.

I know the 5200 has a POKEY and since some 2600 games have a lot of the same funky sounds, I thought that perhaps I might find one in there.

I'll keep digging.

## 2135. Text Adventures -- IF Archive

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-31 11:42:46 UTC
From: daviddayton@potchgult.com
Message-ID: <be5cca2e.0303310342.679eeedf@posting.google.com>
Source record: 22248

I was perusing the IF archive recently and I realised that there are piles and piles of old text adventures written for the Atari 8-bit computers (400/800/XL/XE) that simply aren't present in the archive. As one of my favorite adventures of all time is on that platform (Escape from Dispozon), I thought I'd try to get more of the free/pd/shareware Atari adventures into the archive. The IF archive (http://www.ifarchive.org) houses old text adventures on multiple systems, as well as new adventures, but the Atari adventure selection is very, -very- limited.

Does anyone know of a "quick and easy" place to find most of these adventures for the Atari so they could be transferred into the IF Archive?

Also, given that the archive would be primarily used by folks without an actual Atari, do you think it would be best to pack the original game file and a disk image of that game file (for use with emulators) in a ZIP or ARC file when on the IF Archive?

I really didn't want some of the Atari stuff to fade away... and it really is a great resource. For that matter, feel free to submit stuff to the archive yourselves.. or perhaps we could get together a list of all known Atari adventure games (text, text & graphic, graphic) so none are missed?

Well,
use sparta DOS or MyDOS and try it out! It works, but it is a rather uncommon format on the A8 (double-sided medium/enhanced density with 256 bytes per sector is really uncommon). the A8 normally only uses DSDD 40 tracks (360kbytes), DSDD 80 tracks (720kbytes) and DSDD 80 tracks HD (high density, 1,44 Megabytes; since the tracks cannot be doubled anymore and the bytes per sector cannot have more than 256 bytes, I guess, that the sectors per track are changed to 36 sectors per track...)
-Andreas.

## 2140. Contiki...

Newsgroup: comp.sys.atari.8bit
Date: 2003-03-31 17:12:34 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3E887702.E7B25408@students.uni-mainz.de>
Source record: 22260

Well,
at the moment the A8 version of Contiki (originally created by Adam Dunkels, A8 version by C.Groessler) does not work with any Atari DOS version. So, there are only a few solutions: 1) use RAM under the OS ROM (C000-CFFF, D800-FFFF, approx. 14 kbytes), then Contiki would work at least with some DOS versions, like MyDOS or Bewe-DOS. 2) split Contiki into several parts, some of them loading off of the Ramdisk (i.e use bankswitching from extra-memory) 3) use a bankswitching super-cart. I guess the first point is the easiest one, allthough most Sparta-DOS users won`t like it. But in its current state, Contiki does NOT work with any Atari DOS, this includes sparta... -Andreas.

Hi, Bill, everbody.
It isn't 'Gem Drop X'. I looked at GDX from your
site and it isn't the same as the one my daughter was
playing.
I see you give credit for the idea, can't remember the
name 'Magic something'.
Ok, I'm gonna go see if I can find it....
It's called 'Super Gem Drop' from www.gamehouse.com
She paid for it. It is a little different from 'Gem Drop X'.
I must admit not being too savvy about the point of
either game. I installed and played GDX on my computer.
I'm rambling again.

You don't even need to pass the ML$ address as executing:
X=USR(ADR(ML$),XPOS,YPOS)
puts XPOS & YPOS on the stack and leaves ADR(ML$) in $D4-5 lo-hi. Apparently
Basic evaluates the arguments in reverse order since the last is on the
bottom and the first is on top just below that 'number of parameters' byte;
the execution address is done last and is left in the FP register - a little
serendipity. You *could* also pass it as a separate argument if you wear
both suspenders (braces) and a belt...

Source record: 22253

I sent out a lot of these to different people, if there is anyone that now has a copy of these CDs that is willing to distribute these CDs out to others, please reply to this message.

I am still willing, but I do so at a price. It might be easier and cheaper for other people to do it since my CD burner is so old (and as such, I get so many failed copies and lose so much time in the process) and the post office is a bit far for me and I just want to give everyone a chance to get the CDs from anyone.

So, reply here if you are interested in helping with the distribution.

Actually, there should now be a mostly "finite" number of titles made on the Atari platform. It might be possible to catalog every known title developed for the Atari -- the only problem being defining what the "cut off" is on software... is the 10 line program I made to generate blank pages for printing valid software for such cataloging? Heh.

I remember a few different interesting pieces of free/share type software for the Atari in the past. One piece was distributed as a DCM image... title screen loaded up a (Graphics mode 7?) castle image, then a menu of 3 or so games made by one guy and distributed in just that format.

The other thought I had was concerning what format the files should be stored in on the Archive if submitted. Storing them in the original Atari executables would be nice for the purposes of history, but probably a poor choice for ease of use... as I have a slightly sinking feeling that no matter how many folks still use their Atari's to some degree, a PC clone is being used as a file server or net connection for us all. Storing them as disk images would allow the original files to be kept intact (although you'd need a utility to extract them for use on a real Atari), but also allow easy use for emulators.

A self booting image would be best then... to allow more access to the general public for 'em. Menus were never my strong point... but any suggestions on a decent, quick loading menu type program for the Atari? Or, better yet, the easiest way to make the program just boot up by itself? Storing each adventure as a single disk image might be the best solution in this case...

Well, Autorun.sys would work, I suppose.

And I guess you can forget about loading the R: handler as well....
I still don't see the point, when there are no 300/1200 dialup shell
accounts anymore. Other than viewing HTML correctly there's no use for it.
It's easier to use a terminal program and connect through a proxy box to the
net. Don't get me wrong, I admire the effort for sure and it's always neat
to see something new for the 8bit.....

Hi Andreas,

> at the moment the A8 version of Contiki (originally created by Adam
> Dunkels, A8 version by C.Groessler) does not work with any Atari DOS
> version.

Well, if this is of any help: I've here my "Dos 2.XL" which loads itself immediately under the Os RAM, including its IO buffers, and requires as much as 163 bytes of worthful main memory from 0x700 to 0x7a2. This should be "tight enough" for Contiki, shouldn't it? (-;

It's a Dos 2.0S compatible Dos which formats to 963 sectors/disk with a VTOC layout that is backwards compatible to 2.0S.

Greetings,
Thomas

It's been a while, but I used to use several menu programs on the 8
bit. I could dig around and see what I have, or try to create one
again. Basically you want each game on its owm disk image? or do you
want a menu with multiple games, or both where space permits? Might
be a problem with disks that allow saves, but I'll check on that as I
create the disk images.
As far as the link in a previous post, I've visited there before,
but it seems to concentrate on the commercial programs and not the
ones that are not 'professionally' created. Some of the non
commercial games are better than some commercial games in my opinion.
Might as well start a running list of adventures here.

Anyone remember 'GFS Sorceress'?

Hello Andreas,

the current version of contiki is not a finished version, more like a first
working preview. The delevopers are aware of the memory problem, everyone
is invited to read the contiki mailing list archives -->
http://sourceforge.net/mailarchive/forum.php?forum=contiki-developers
to get more information on this topic.

Please don't misjudge this program in such an early stage.

Carsten Strotmann

AS I said, you are obviously ignorant of the facts but you may go on through your life thinking what you will. The point is really, by the tone of your first post that you seem to have an anti-American bigotry so I have to consider you and your statements to be biased with left-wing rhetoric. The fact is that in war accidents happen, they always have and they always will. A British jet was shot down because it was not emitting the proper IFF signal to determine it was friendly, had it been then it would not have been shot down. As far as your friendly-fire British casualties, I will try and educate you by presenting facts as released by your own goverment, not biased liberal-media spin:

These three British soldiers are thought to have been killed by friendly fire, but it is unclear at this point who the friendly fire came from:

Lance Cpl. Matty Hull, in combat in southern Iraq; death is being investigated POSSIBLY as result of friendly fire
Cpl. Stephen John Allbutt, Stoke-on-Trent, England, tank hit by friendly fire
Trooper David Jeffrey Clarke, Littleworth, England, tank hit by friendly fire

The Jet carrying the following two British pilots was not emitting the IFF (Identification Friendly/Foe) signal that it should have been emitting and appeared to ADA gunners in Kuwait to be a hostile aircraft or inbound missile. And just for your information, we Americans (at our own expense) developed the IFF system to try and AVOID firing on friendly aircraft. Either the technology broke or the pilots neglected to turn it on.

Flight Lt. Kevin Barry Main, jet shot down by friendly fire
Flight Lt. David Rhys Williams, jet shot down by friendly fire

In addition to this, 14 of your servicement were killed in helicopter crashes... not attributed to friendly fire but either to hostile ground fire or mechanical failures.

The British military has also suffered these additional combat losses:

Unidentified soldier, killed in southern Iraq while disposing of explosive ordnance
Marine Christopher R. Maddison, combat in southern Iraq
Lance Cpl. Shaun Andrew Brierley, road accident in Kuwait
Sgt. Steven Mark Roberts, Bradford, England, combat
Lance Cpl. Barry Stephen, Perth, Scotland, combat
Sapper Luke Allsopp, London, combat
Staff Sgt. Simon Cullingworth, Essex, England, combat

So, now I have to ask you to explain your statement:
"So are YOU happy with such a high rate of friendly fire casualties"

Where is the high rate of friendly fire casualties you claim and from what supposed "FACTS" do you base this statement on? Three of the Five of your friendly-fire casualties are non-conclusive at this point. I surely do not expect that a little thing like hard evidence released by your own goverment will dissude your apparent dislike for Americans and your subsequesnt feeble attempts to make us look as bad as possible but I am satisfied based on my own unbiased research that you have zero credibility and have obviously not done real research from official sources to support your rash and biased statements.

The really sad thing is that I with my American "jingoistic tinged shades" on have had to provide you with a full accouting of the casualties of your own military (current as of today), which you obviously had neither the inclination or ability to find out for yourself. Your European dis-illusion of having some sort of morale superiority and your self-described situational enlightenment that you think Americans lack really just boils down to your ignorance of the facts and petty anti-American bias.

Good day :]

Hello All,

I currently have a few Atari auctions running, mostly for software, but also a copy of the AMS 1996 video on PAL VHS tape.

The link is below (this will split on to two lines, so please copy both lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangar raghty

Either way you look at this it boils down to two people calling each
other similar names or there abouts.

Lets hope that the two sides find these WMD or it could be curtains
for both leaders, especially if many innocent folk die in the search
for these.

I think at this point it doesn't matter if we find any WMD, just as long as we free the people. There is enough evidence to prove there WAS WMD, but may no longer be any around.

Look at this

http://www.irata.info/mule/cartridgebox.jpg

You will notice a cartridge in the box labeled M.U.L.E.

Does anyone have any info or plans on how to do this?
(yes I have blank a pcb and an eprom burner)

If so please reply or email me i_r_a_t_a@SPAMyahoo.com remove "SPAM"

I would like to add the plans to my website www.irata.info

thanks,
Tom

That box is Nir Dary's, and the cartridge offered on eBay was probably his too. He (or a friend) has made several cartridge versions of various games. I remember seeing a Bruce Lee cartridge he was selling on eBay one time.

What I wonder is how difficult it is to hack a game onto cartridge? Does he make the whole game run from A000-BCFF, or does he have some kind of loader on the cartridge that copies the game code to its "normal" position and then execute from there?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

But that's not what the war was waged on, it was and is being waged on
the basis that Saddam DOES have WMD and they are there to dismantle
them.

It's only that Bush is now veering away from that line as he's now
playing it under 3 cards.

1. WMD
2. Sept 11 links
3. Finishing the previously started job.

He's always linked these but as time goes on and there's no real
weapons found (so far) he's now widening / relying on the other
reasons for the war to make it more acceptable.

Blair has solely placed the war on WMD and it's emerging that there
could be legal recourse against the government as regarding Iraqi
civilians being killed.

So lets imagine a worse case scenario, lets say that the battle for
Baghdad causes horrendous casualties for the forces and at the end of
it no weapons are found. Do you think there will still be the same
support for either leader when at the end of it there will be one
dictator (from an endless supply) less and a whole lot of dead people
at extreme cost both monetary and emotionally all to free a land
thousands of miles away which they will have to walk away from sooner
or later.

The last war and the economic stress caused Bush Snr his job.

Lest we forget that this war has caused severe stress in the Arab
nations who are not exactly happy with Bush or Blairs Israeli policy,
at least finding WMD would be perfect leverage and proof.

I support the forces, they are doing an incredible job, sadly I don't
think the politicians anywhere near half thought all this through
properly.

Source record: 22201

Hello,

I'm looking to buy a complete Atari 800 system (disk/ tape drive, joysticks, etc). However, the problem is that they are VERY rare here in Western Australia. I've not seen one in all of the years of my searching.

My post to this newsgroup serves two purposes: a) to find someone in Australia who has, or knows of someone who is selling a system, or b) to find someone overseas who can quote costs on purchase and delivery to a suburb called Victoria Park (or Perth), WA (Western Australia) for a complete system.

Using an emulator doesn't so justice to the good old days, and my need to use the "real thing" is increasing on a daily basis...

Hoping to find someone out there who can help!

Thanks,

Paul...

Tough for quite a few games, easy for maybe 1/3-2/3.

Quite a bit of disk based software is just cartridge software that was
pirated and turned into a disk file. All of these have a short header init
code that lowers ramtop and sets the screen up<mostly via an illegal call to
the OS>, then loads the cartridge image into the RAM and runs it from there.
Turning those back into cartridges is fairly trivial.

Some of the early cassette software is fairly easy too. Most of the programs
were rather short and were made to run on either an 8k or 16k machine. They
can be burned into carts and simple ML move ~40-50 bytes to put them in low
mem where they want to run a jump to their init/run vectors is all you need.

I got SpeedScript to run from a cartridge but lost some things like the
special mode 3<?> character sets with descenders. The program was just too
big to fit in an 8k cart w/o special stuff like bank switched carts.

I failed miserably on Berzerk and Salmon Run. Been a while so my memory is
foggy on it. IIRC it was the Berzerk with the speech so it was over 16k. I
never did a disassembly to cut out the speech. I don't remember the problem
I had with Salmon Run off hand, but I think it was similar in stuffing 17k
of code in a 16k of cartridge space.

Source record: 22204

Ok, my drive stopped working, and upon opening it, I found a wire had come off pin 2 of the 2793, which I can fix. Now the problem. There is a switch on the front of the drive, I have never understood, and some of the wires are no longer connected as follows. It is a six pin switch, the middle two are bridged, one bottom pin is connected via a resistor to 1 pin of a 2 pin LED, the other pin of which is connected to the main board underneath near the drive LED. Then there are two wires, which I guess were fixed to the switch, one of which is still fixed at the far end to the top of jumper 7 in the middle of the board, the other is loose. Does anyone have any idea what this switch was for, and where the other wires should go to? If it is a write/protect switch. I have never seen one wired like this before, can I safely remove it. The instructions for the board make no mention of these wires at all. Help, please !!

Richard

## 2195. Looking for an Indiana Jones game

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-03 21:36:57 UTC
From: Vidar Olavesen <hawk@nmi.no>
Message-ID: <ZO1ja.1105$8g5.13468@news2.e.nsc.no>
Source record: 22208

I am not sure exactly what it was called, but I think it might have just been Indiana Jones. It is perhaps the same game as Aztec, a platform game. Might be other levels. Anybody know which game that is ?

Also looking for an old one, Dino Eggs.

Any help appreciated!

> and then execute from there?

If you have bankswitched cartridge with switch-off capability - then
it's really easy (at least for any dos executable). For multistage disk
games it's much more problematic. Such cartridge behaves as rom disk
(the software is booted off it and then turned off).

After long nights of desoldering, and replacing chips from an 800xl, I've got it 95% working. It was the cpu and rom that had gone. It only works only on cartridges with the OS from the 800xl in it, is there anywhere in the UK that sells replacements?, or can anyone give me a link to the 32K XEGS rom image?, I have looked everywhere but I can only find the OS rom (16K) I need the 32K rom image with the OS, Basic and Missile command in.

Cheers!

I looked for xegs os rom.
Freddy Offenga has a collection of os roms.
The one for the xegs he has I don't know if it is
ntsc or pal. The ROM he has for the xegs doesn't
include the BASIC and Missle Command ROMs.
He states that xegs uses a 32k ROM, 16k OS
plus BASIC C and Msl cmd.
Anyway Freedy and someone else (from NL) seem
to be experts on 8-bit ROMs.
A google search for freddy offenga should get you
his A8 developer's page.

The geeks, nerds, and spazzes at atariarchives.org are proud to announce that the full text of Compute!'s First Book of Atari is now available on the Web.

Published in 1981, this classic book includes articles printed just after the release of the Atari 400 and 800 computers. It includes early reviews of Atari BASIC, DOS 1, and the Atari 810 disk drive, plus unique BASIC and machine language tutorials. The first chapter includes an interview with Atari's VP of marketing, examining the early '80s personal computer market.

All of the book's type-in programs are available for download. This is the 13th book to be made available at atariarchives.org.

It's available at
http://www.atariarchives.org/c1ba/

Can't blame them a bit, I'm still trying to get over the new names
Washington came up with for 'French fries' being 'Freedom Fries'. It
reminded me of the story my grandma told me about how our family changed our
surname from Steinbrenner to Johnson during world war 1 because of the
oppression the American-Germans were faced with, much like the modern
middleeastern-americans are today. I hate off topic posts, but I've got to
put my two cents in on this one. I think Bush is setting this country back
decades....

A Gamedos would not much help, because these GameDos don't install a "D:"
handler. To work with Contiki you need a "real" dos (with open,get record,
put record, open directory, format ... commands), not just a binary loader.

DOS 2.XL from Thomas Richter is not the same as DOS XL from OSS/ICD/FTE. DOS
XL has a normal memory footprint (lowmem around $2000) and can load some
routines under a OSS Cartridge or the XL-ROM, whereas Thomas DOS 2.XL (as I
understand it) load almost fully under the OS ROM just needing a handful
bytes in the lower ram, so lowmem is around $800.

Carsten

I don't question your good intentions (I know you as a person who is happy about every new ATARI development :) ), I just don't want that some people here think that Contiki is unusable because there is no DOS to start it and no memory free to use it.

Suggestions and solutions are alsways welcome to the developers mailinglist.

Ciao

Carsten

You don't need a hardware hack for using a ST mouse with your atari 8-bit. Just plug it into the joystick port and try it out. I would recommend Missile Command, Shanghai or S.A.M. (german Geos clone).

If you want to use the right mouse button for alternate functions or context-menu's you will need to install a little modification, which enables the pokey to read out that kind of information. I don't know much about this hack, but it should be possible to find it somewhere in old atari magazines.

There are also several mouse drivers and handlers availble, which can be used for own programming. But keep in mind, that there are always restrictions when you are using a st mouse with your xl/xe. The st computer has an own hardware chip, which controlls the incoming analogous data from the mouse and converts into usable x,y-parameters. Unfortunately, the 8-bit does NOT have such a chip inside. So the drivers are just emulating that behaviour and this needs -of course- memory and process time. Some drivers are really lean and very optimized, so you can use it even with hires graphics-modes and the mouse just feels "very smooth" (Example: SAM Designer, Shanghai).

have fun.

Don't forget that 7800 is not an Atari developed machine. Also, whole XE
line is just repackaged old stuff.

>Don't forget that 7800 is not an Atari developed machine. Also, whole XE
>line is just repackaged old stuff.

This is not completly true, The 7800 was made before the XE line, secondly the latest XE (China version with GTIA bug) where made at the end of 198x and beginning of 199x. For this last batch they made new GTIA chips with a buggy mask.
Because Atari wanted to have a 'new' XE style XL compatible system they continued there design from the XL series. A super XE would be cool... I think it can be done when someone connects the 7800 graphics chip to the XE, Atari can disable ANTIC so a new video chip can be addressed at full speed...

Is there someone that would want to make such a upgrade? :-)

The powers that be decided there was no future in 8 bit systems.

You have to remember that even the design team for the Atari 800 had moved
on to projects like the Amiga.

Apple pushing the Mac, IBM got in bed with the Intel and MS got in bed with
IBM. It became a 16 bit market place.
> Most software programmers complained that the ATARI has not enough
> sprites - compared to the C64 , this would have been no problem if the
> ATARI 800 XL had the 7800's graphics hardware.

C64 came out ~3 years after the Atari. Kind of like comparing a PC to an AT.
That they are so close in performance is what is unusual except that C64 had
a better price point.

The great price and success in the market place is the reason why most
software programmers supported the C64 and didn't support the Atari. Atari
had a much smaller user base then the C64.

The bottom line is it ultimately didn't make a difference. Both C64 and
Atari went south. Yes it would have been nice had Atari come out with
improved graphics, but they still would have gone under.

Hi TXG,

would be a nice mod to put the Maria into an XL/XE. The 7800 OS is
pretty much the same as of the XL except the screen handling.
As far as I know the Maria decodes it's address range itself as the
Antic but at a totaly different address area. I think it's page 1 but
I'm not sure.
The question is what is easier, to modify a XL/XE to put the Maria in
or to modify a 7800 to be a XL/XE?
In the later case the SIO and keyboard connectors must be added and
the OS rewritten as in the first case.
I think the second approach would be easier.

What do you think?

Regards
Frank

This could be tricked by some logic, to let the system think it works in
page 1....

> The question is what is easier, to modify a XL/XE to put the Maria in
> or to modify a 7800 to be a XL/XE?

The XL/XE only has to be attached to the MARIA chip, this is much easier....
Maybe we can use the socket of the original ANTIC for an adapter board...

> In the later case the SIO and keyboard connectors must be added and
> the OS rewritten as in the first case.
> I think the second approach would be easier.

not interested.... would like to have a MARIA chip as an option so that I
could turn it off or on.....

Yeah, That is it, like I said, I was one of the few people to get credit for writing software for Datasoft. A few others that, like myself brought finished titles to the company for distribution did negotiate credits to be included. However as Datasoft grew and started to hire it's own programmers to work in-house the credits disappeared. There was a big flap at Atari when William Robinson put some Easter egg code in Atariwriter (originally a Datasoft distributed product) that put his name on the screen when certain joystick switches were pressed. They sued him and ordered many of the Rom based Program cartridges destroyed.

Hello,

My father is wanting to sell some old Atari equipment to someone in the Atlanta, Georgia area. He is in Louisiana and will be visiting me during the week of May 4th thru the 8th. (Woodstock/Acworth GA Area)

The list of old Atari equipment he has is as follows and he wanted to know what someone would be willing to pay for this equipment (All in good shape):

ATARI 400/800 COMPUTER STUFF

1 ea. 400 Computer
1 ea. 800 Computer
1 ea. 810 Disk Drive
1 ea. 1050 Disk Drive
1 ea. 410 Cassette Recorder
1 ea. 850 Interface
1 ea. SX212 Modem
1 ea. 1020 Printer
1 ea. 1027 Printer (needs print belt)
5 ea. Transformers
Spare 400/800 circuit boards.

400/800 Technical & Modification info.
400/800 Tech. Ref. Notes.
400/800 Guide to effective programming.
Service Disks & translater.
Archiver Package.
Syncalc disk & doc.
Analog Mag. Compendiom
Antic & Analog Magazines

Thanks

Curtis

# 2234. Question about disk drives and monitor interference

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-06 01:40:29 UTC
From: john@jrcc.net
Message-ID: <de16c5ec.0304051740.337974e8@posting.google.com>
Source record: 22147

Hi all,

Anybody got any suggestions for shielding floppy disk drives from monitor interference? I've noticed that when I place my Atari 5.25 disk drive near my monitor they do not function properly. I assume this is because of emissions from the monitor. Space is at a premium for me. What I want to do is build a small hutch with space for two drives and a shelf for the monitor on top of the drives. If I line the top, bottom, and sides of the bay that will hold the drives with a heavy gauge of metal will that prevent the monitor emissions for interfering with the drives? I'm also open to any other suggestions that anybody might have.

Thanks,
John

Message-ID: <v8v36lb6j4m7d7@corp.supernews.com>
Source record: 22149

I had this problem with my Atari ST, never with the
8-bits. However I never put a monitor very near
an 8-bit drive, so maybe that stopped it from occuring.
On the ST, I kept getting trashed floppy disks, and
the computer couldn't read or write to floppy. I had
built a wooden shelf with two shelves, the top for
my monitor and printer, a low hieght shelf about 3 1/2"
high under that for my floppy drives. My floppies were
directly under the SC1224 color monitor.
After I found out my monitor was causing the SF351
not to function, I put a cookie sheet under the monitor,
all my problems disappeared, interference type any way.
I had already learned not to have a floppy disk in the
drive and power on or off with a power strip, this caused
the 'busy' light to blink and a nice magnetic defect hole
in the floppy. I do the same with my parallel port
PC zip drive, never have a disk in and turn power on
or off.
So, yes, a metal lining on the shelf you put the drive on
should stop the interference from the monitor.

Yes it is possible if you use a modified 1050 or standard XF551 to
read the PC written floppy. The 1050 has to be modified to read
double density instead of just single density or 'dual' enhanced
density that a stock 1050 can. US Doubler, Happy, and several
European upgrades qualify. Only 180k or 360k ATRs can be read
or written with WriteATR program, but within those restrictions,
you are good to go.

# 2242. Re: PC 5.25 floppy drive to read/write ATR images?

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-06 07:52:58 UTC
From: Mo <momo@atariland.com>
Message-ID: <u1Rja.10047$Q27.590008@twister.austin.rr.com>
Source record: 22155

There are a couple of controller boards around like the 'catweasel' at about $85.00 US it will do many different formats. Also the Adaptec 152X SCSI controllers are capable of reading/writting single density if you could find an emulator that supported real PC floppy drives and a 360K floppy to hook it up to.

I have a 130XE keyboard problem... The following keys 8, T, I, A, S, D, F, G, H, B, M, Help, Start, Select, and Option, do not work. Do you think that the chip problem inside 130XE, wire inside plastic seems to be wore out, or what else its cause is? Please help me how to solve this problem, thanks!

> (with a disk inside).

It shouldn't matter as long as you don't use it as a football. There is only one head (single sided) and it rests on a felt pad when the drive lever is in the closed position. In the open position it is held away from touching anything. Paul

From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <b6rcsm$dlf$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 22165

Hi,

> It is possible to get new colors when you use player/missiles over the
> normal character graphics (Graphics 12).

Well, you get the player/missle color registers as a bonus, of course.
(Hence, four additional colors), but not in arbitrary places.

> It seems like you can get characters with at least 7 colors - 4
> original colors + 3 additional colors from the players.

Not quite. The four p/m colors cannot be positioned independently.
You either have a limited resolution (by using wide players) or a limited
horizontal position (by using small/regular sized players).

> And it is possible to get another color by using inverted characters ,
> this color can be changed by player 3 and 4.

No, you don't get any additional color by inverting; Playfield graphics
in antic textmodes 4 and 5 use playfield register 3 instead of playfield
register 2 if the hi-bit of the character symbol is set, but that doesn't
interact with player/missile graphics in any way.

> Since it is possible to change charsets with DLIs every 3rd line , it
> should be possible to treat the charset mode just like any bitmap mode

Just with ugly addressing. Now, what would be the benefit of that? You
could replace a fourth playfield color instead of PM2 on every 8x8 subblock
of graphics. And you could get additional four colors, but either with
ugly resolution, or rather limited freedom concering the placement.

> and even make a vector-graphics game.You just change the characters
> just like you change the bitmap in a bitmap mode.

IIRC, Spy vs. Spy did this, though not a vector graphics game. The C64
"bitmap mode" is something very similar, it shares "ugly addressing"
by the character mode, and just drops the character map.

> Because the problem of most ATARI games is , that the use all the
> players for a few moving objects and 1-colored-players donï¿½t look very
> good comapred to the C64ï¿½s multicolor sprites.

And how does your idea resolve it? You either use all players for additional
playfield colors and have to use "software emulated" players with rather
restricted color definitions? Seems like a bad trade for me. In most cases,
you're better off using specialized DLIs for the purpose of your game.

Consider for example the "Activision" games like Decathlon, Pitfall 2, Zenji,... The "sprites" look rather colorful, don't they? And still, these are simple GTIA sprites, just recolored by a vertical kernel that provide the colors on a line-by-line basis. This much more practical.

As a matter of fact, GTIA has only eight color registers, giving you eight colors per scanline, unless you're using horizontal kernels, but leaving you only the VBI for the game engine.

Oh, and there's another less-known fact: Player/missile graphics and playfield graphics can mix. Set the priority engine of GTIA to mode 0, then playfield 0,1 and players 0,1 combine their colors by "or'ing" the colors together, and so do playfield 2,3 and players 2,3. Unfortunately, this also grands a very restricted color selection.

Greetings,
Thomas

Doesn't sound like a chip problem to me since keyboard keys and the
console keys ("start,select,option") are handled by different custom chips.
Sounds more like a contact problem on the ribbon cable connecting the keyboard
to the mainboard. Try to clean it, maybe some contact spray may help you.

Greetings,
Thomas

# 2254. Where can I find Casten Game Disk?

Newsgroup: comp.sys.atari.8bit

Hi,

>> Not quite. The four p/m colors cannot be positioned independently.
>> You either have a limited resolution (by using wide players) or a limited
>> horizontal position (by using small/regular sized players).

> You get new colors were the players are over a background pixel.This
> creates 2 new colors for player 1+2 and the color of the player
> itself.

Define "new colors". A pixel of a player is one color clock wide, giving
you a maximum horizontal range of 5*8 = 40 color clocks that can be colored
by this technique, requiring that eight color clocks share the same "additional
color", where it is possible to select between "additional color on" or "off"
on a color-clock by color-clock basis.

Alternatively, use wide pixels granting you 5*8*4 = 160 color clocks = the
size of a "normal playfield". This allows you to give every color clock an
additional color, but each four color clocks must either use the additional
color (player bit on) or not (player bit off). Moreover, the additional color
register is fixed for 8*4 = 32 color clocks = the width of the player.

>> No, you don't get any additional color by inverting; Playfield graphics
>> in antic textmodes 4 and 5 use playfield register 3 instead of playfield
>> register 2 if the hi-bit of the character symbol is set, but that doesn't

> But Iï¿½ve tried it : Player 3&4 change the color of the registers
> 710/711 , that means thereï¿½s a new color were a player bit and a
> background bit is set.

See below, but that's not related to inverting, and works only with
GPRIOR = 0. It also puts players 0,1 behind playfield 2,3 (rendering them
useless here) and players 2,3 in front of playfield 0,1 (granting no
additional mixing here).

>> Just with ugly addressing. Now, what would be the benefit of that? You
>> could replace a fourth playfield color instead of PM2 on every 8x8 subblock
>> of graphics. And you could get additional four colors, but either with
>> ugly resolution, or rather limited freedom concering the placement.

> No , you just treat charset mode like a bitmap mode.You can change
> pixels by altering the characters and by using DLIs it is possible to
> change the charset every third line.

I understood pretty well. That doesn't change the fact that the address
of a pixel on the screen is "ugly" (-; Pixels are not linearly addressed,

but you'd rather need to compute the "character container" they belong
to. I do not doubt that you *can* draw graphics on a screen constructed
like this - clearly. All I say is "it's a pain in the ass". (-; Given the
rather limited performance of a 6502 (= "darn slow") you cannot really
expect any performance for real-life applications if you need to combine
this with additional color magic from players.

> Movement can be as smooth as with bitmap graphics , but
> double-buffering is faster !

I've to admit having trouble to combine words like "fast" and
"6502 at 1.79Mhz" (-;, but besides that you'll still have a striking performance
problem here, namely that a simple movement of the playfield is no longer
a bitshift or a data movement as it is with linear addressing. Again, I have
no doubt that you *can* do that if you want to. Question is whether it is worth
the colors for "real life" applications. I also agree that you could run some
specialized assembly routines for demos, but I've my doubt that you'll be able
to use this in a playable game.

>> And how does your idea resolve it? You either use all players for additional
>> playfield colors and have to use "software emulated" players with rather
>> restricted color definitions? Seems like a bad trade for me. In most cases,
>> you're better off using specialized DLIs for the purpose of your game.

> You can use only 1 player to get 3 additional colors

Where? Only in eight color clocks per scanline (one extreme) or in 32 color
clocks per scanline, with four neighouring color clocks sharing the same
color (the other extreme). That's not much of an additional color. What has
to happen if I need to render two independent objects sharing the same
color, but that are aparart by more than 32 color clocks?

> and have a
> 7-color software sprite.This is far better than 1-colored players.

If all I want to do is to draw a colorful picture, yes. If I want to move
this fast, no, unless again there's nothing else for the CPU to do (i.e. its
a "demo").

BTW, you'll find similar hints in the "De Re Atari" for using more colors.

Greetings,
Thomas

But you don't need a D: handler in Contiki (currently at least), since
it doesn't do file I/O.
So a Gamedos used as a loader is OK.

But having a real DOS would enable one to load other R: handlers which
are only avaiable in file form.
I will look again into you 3sDOS if it's possible with it. DOS 2.XL
probably would also be a solution.

Hon,

well, you might have a problem with the contacts where the mylar plastic
slides into the connector on the 130XE board. If you took out the mylar
contacts off the connector too many times the silver printed lines get
removed/damaged and do not conduct good enough any more. (even if they
still look good, use a resistance meter to check)

I fixed that problem with conductive silver paint from the electronic store
and a very very small paintbrush.
You shouldn't tremble however when you apply the paint..
:-)

I hope that helps

cheers
Chris

Maria is realy an ANTIC and GTIA in one chip except the switch and
trigger inputs. The GTIA could stay in the system with MARIA just for
reading triggers and switches.

MARIA does DMA but does not support DRAM!! No refresh. Means change
XL/XE completle to SRAM or build a sepparate refresh.

I found the following info:

Pinout MARIA II (1702B):

--- ---
VSS 1-| U |-48 SYNC" Pins marked: ' have an ANTIC

>> I'm led to belive that they are based on Apple ][ 's to a degree

I always thought that too... I saw an old one with a BASIC that looked an awful lot like Applesoft, because perhaps of the horrible blurring of even 40-column text on the demo TV.

However, Applesoft could be considered a least-common-denominator for what an extended BASIC should do, and was just copied for that reason... as I recall, the Coleco ADAM had a workalike, but it was obviously different (based on a Z80!)

The folks at atariarchives.org are proud to announce that the full text of the classic computer book Creating Adventure Games On Your Computer is now available on the Web. Written by Tim Hartnell and published in 1983, the book includes four complete adventure games in BASIC plus innumerable tips on creating your own text adventures.

The book's BASIC programs are compatible with Apple II, Atari 8-bit, Coleco Adam, Commodore 64 and Vic-20, IBM PC, Texas Instruments TI 99/4a (with Extended BASIC), all TRS-80 models, and MSX BASIC. All of the programs are downloadable for instant gratification.

This is the 14th classic computing book to be made available at atariarchives.org.

To load it, a game dos is ok, but if you like to do real work (in a later
version) like saving web-content or e-mail, you will need a "real" dos.

>
> But having a real DOS would enable one to load other R: handlers which

3sDOS is very limited this time (read only, only 1st 8 Directory entries, no
Autorun...). DOS2.XL is more complete.

Hello to all hardware guys!

Will it be possible to use this chip for a cheap SIO <-> USB solution?
http://www.codemercs.com/IOWarriorE.html

It would be fine to use a Atari 1050 with a PC (i.e. Atari emulator)... ;)

i think you are thinking of the vTech IQ Unlimited Computer that Tom
Bosley used to do an infomercial for. I had one. It reminded me more
of a Tandy CoCo than anything (almost like a VZ200 also by Vtech which
I also have).

Source record: 22184

Well,
afaik Nir uses some kind of loader to copy the game back to its normal
memory position. This is easy with games that do not use the memory area
8000-BFFF, it is a little more complicated with games that do. As you
know, when installing a cart, the area 8000-BFFF becomes ROM and thus
games that normally use this area would not work. The only way to get it
working is turning off the cart (so you will first see a little garbage
and 1-2 seconds later the game appears)... -Andreas.

P.S.: standard Atari XE/XEGS carts cannot be turned off, they have to be
modified to do so...

Message-ID: <3E930EF7.703EA056@students.uni-mainz.de>
Source record: 22185

Well,
I know two games: 1) Indiana Jones and the Temple of Doom (originally
released as a commercial game); it can nowadays be found in many PD
libraries under the name "beneath the pyramids" (or the similar game
"Quest of Power"). 2) The Adventures of Dr. Jones, a game written in
basic, that comes on two disk sides ( a sort of jump and run game).
Think it was also released commercially, but nowadays has its place in
many PD libraries... -Andreas.

Well,
there is no need to convert an ST mouse to work on XL/XE Ataris. Any A8
game that supports an ST mouse will work with it. The only conversion
that might be needed is to make the second fire button usable - but
there are only 2-3 games that support or require the second mouse
button. All other games merely use the first mouse button...
-Andreas.

Well,
I do not know the C64 program GEOS (I dont have a C64, so I do not know much about C64 software). Anyway, the german GUI SAM was first published in the german Atari magazin 1988-1989 as a type in listing. By that time, most Atarians still used Dos 2.5, so it was based around that DOS (meaning some functions will only work correct under DOS 2.5 and medium/enhanced density), for example the Quit or Exit function directly jumps to DOs 2.5 DUP.Sys - it will not work with any other DOS. The GUI came with a text-editor (SAM-Texter) and a painting program (SAM-Painter) which uses Gr. 15 plus DLI`s (up to 128 colors, like Fun with Art). In my eyes it is a nice GUI, that can be controlled with joystick or ST-mouse. But it is very sad, that this GUI depends so much on DOS 2.5.

SAM was later sold commercially with many add-ons, but still dependant on DOS 2.5 and 64k computers (extra RAM was merely used as a Ramdisk with the normal DOS 2.5 ramdisk-drivers). That`s why it never became very popular. An english version of SAM is available from Dean Garaghty Software (DGS from the UK). Anyway I still have all those type-in programs (they are PD right now) that work quite good as a test or demo version of SAM, including the text-editor and the painter program. If you are interested in a copy of this type-in-program, send me an E-Mail and I will return an ATR image. If you would rather like the commercial program with all add-ons, then contact Dean Garaghty...
-Andreas.

Well,
I don`t think an Atari with Maria chip would blow the C64 away. Hint:
How many programs are there for the A8 that support or use a Maria chip
?!?!! None !!!
-Andreas.

Source record: 22192

Well,
there are already some demos and pictures available that use this trick.
For example Bewesofts/ Jiri Bernaseks "Seaside" demo uses gr. 8 with 4
or more colors (while using PM). There are also pictures called *.GED
which afaik produce 13-14 colors by using both players and missiles,
next there are *.MCS pics that produce approx 8-9 colors by using
players only... -Andreas.

P.S.: I do have some examples in my PD collection. However these pics
were never used in games, since one would have to program
software-player-missiles then; those software "sprites" require a lot of
memory. A few demos and/or games used such pics as intros...

## 2278. Availability of MAC/65 Assembler cartridge?

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-08 21:17:21 UTC
From: john@jrcc.net
Message-ID: <de16c5ec.0304081317.6c995e2b@posting.google.com>
Source record: 22182

Anybody know where I can buy a MAC/65 assembler cartridge?

Thanks,
John

# 2279. Re: Question about disk drives and monitor interference

Russ,

Thanks for the feedback. I tried the cookie sheet test and it worked. Simple but effective. I'll try cutting it down with a band saw into something that looks a little less jury-rigged. But at least the concept has been proven.

Thanks,
John

I have a mac cartridge . If your interested let e-mail me.

# 2281. Re: SIO <-> USB

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-09 06:13:35 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <b70dmg$9i4mc$1@ID-174234.news.dfncis.de>
Source record: 22194

Hello Sascha,

Members of the Atari Bit Byter User Club (Thomas Grasel, Marc Brings, Harry Reminder and more) are working on an USB Cart based on the design of guus assmann (see --> http://www.strotmann.de/twiki/bin/view/APG/ProjUSBCart )

We have some plans for a USB <-> SIO Device, but these plans are today not ready for wide release. We like to have a real working device with all software support before we de a public announcment.

We have seen the article about the IOWarrior in the german magazin c't (this week) and thinking about this solution.

If anybody plans to work on a SIO <-> USB solution, it would be nice to write us an email so that we can exchange our findings and coordinate projects in order to prevent double work. The USB protocol can be complex, and we have now (only) 1/2 year of knowledge on how it can be done on the A8.

Best regards

Carsten

UPDATES SINCE PREVIOUS POSTING
2003.04.03 Steven J. Tucker (updated phone number)
2003.03.29 Carsten Strotmann--many
2003.03.17 Adam Dunkels, Christian Groessler (Contiki 1.0 for 8-bit Atari)
2003.03.14 Mark Grebe updated (Atari800MacX 1.3.0)
2003.03.11 Adam Dunkels added (Contiki)
2003.03.11 Thomas Richter updated (Atari++ 1.20)
2003.03.11 Carsten Strotmann updated (3SDOS 0.8)
2003.03.10 Ron Fries updated (PokeySound 2.3)
2003.03.03 Dan Vernon updated (Atari810 1.4d)
2003.03.03 Komires updated (EMUAPC DEMO 0.91 Beta)
2003.02.28 Video 61 updated (Star Flite 3.5)
2003.02.28 Radek Sterba (Raster) updated (Raster Music Tracker (RMT) 1.1)
2003.02.28 added Thomas Richter (Atari++ 1.19 emulator for Unix/Linux/..)
2003.02.25 Bravo Sierra Computers (BSC) (Ben Smith) updated
2003.02.24 Marek Mikolajewski updated (SIO2IDE 4.1)
2003.02.24 Hias Reichl updated (MyPicoDos V3.0)
```

2003.02.22 Petr Stehlik updated (Atari800 1.3.0)
2003.02.22 Hias Reichl updated (AtariSIO V0.10b alpha)
2003.02.22 Carsten Strotmann updated (Multi Zoom Master)
2003.02.22 Video 61 many new carts added
2003.02.08 added Carsten Strotmann (Kaiser II)
2003.02.04 removed Thomas Richter (atari++ emulator project shut down)

---

Subject: Introduction

Conventions
---
All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

SAE/SASE/IRC info from http://www.genfair.com/greenpages/sae.htm
---
It is courteous when writing to any new correspondent to cover in advance their postage costs in replying to you. If they are in the same country it's a simple matter to enclose an SAE (stamped addressed envelope), which is known in American English as an SASE (self-addressed stamped envelope). It is not always obvious how to do this for correspondents in another country. One answer is to use International Reply Coupons.

An International Reply Coupon can be purchased at any Post Office in any country in the world. This is agreed through the Universal Postal Union. You can then send the IRC to someone in another country who can cash it in at a Post Office there for a postage stamp covering the minimum rate for an Airmail letter (unregistered).

One IRC enables a letter up to 10 grammes to be airmailed abroad. That's not much more than a couple of sheets of paper. So if you want a reply with more

than this, better send two or more IRCs!

Verfications -> YOU!
---
This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

---

## 2284. 8-bit File Copy Program with Mouse?

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-09 10:09:33 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030409060933.16855.00000939@mb-fh.aol.com>
Source record: 22098

Is anyone aware of a file copier (for MyDos disks) that uses a Mouse for file selections? I've got lots of files to sort...
Thanks,
Larry

I only found Pyramids of Giza, any tips on where to find these ? It's not in
BASIC, so that's out, and it's on one disk side and looks totally alike
Aztec. I do have the file version, which I, stupid me, cracked once and
didn't keep the full disk side version.

# 2286. Atari 1010 info needed

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-09 11:04:20 UTC
From: Alex Taylor <alex_taylor@nospam.ntlworld.com>
Message-ID: <38Tka.2449$HZ2.861@newsfep4-winn.server.ntli.net>
Source record: 22099

Hi

I just picked up an Atari 1010 program recorder from the local tip. I have a couple of spare SIO cables, but I don't have a PSU for it. *Before* I go and blow it up, could anyone tell me what voltage and current this thing requires? I have an Atari PSU with a barrel-type plug on it, but don't want to try it until I have the info.

Many thanks in advance

Hey Steve - I just got around to trying out the CD's and my disc 2 and 3 have errors on them (and thus can't be copied, nor can I copy *all* the files from them).. Is there anyone in the area that has good disc's 2 and 3 that can either make an image or a copy of them? If you have broadband an image would be great, we could just transfer it via IM or I could set up an ftp server or whatever..

Thanks,

Frank.

# 2288. New AtariSIO release V0.11 beta

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-09 16:50:58 UTC
From: Matthias Reichl <usenet-20030409@hias.horus.com>
Message-ID: <slrnb98jri.1o9.usenet-20030409@camel.hias.horus.com>
Source record: 22101

I've uploaded a new AtariSIO release to my homepage
http://www.horus.com/~hias/atari/

Version 0.11 beta includes the following changes:

* atariserver now contains loadable 6502 highspeed SIO code
(like the HDI or Speedy 1050) - thanks to ABBUC for the code!

* A "print DOS2.x directory" function was added to atariserver

* AtariSIO now reached beta status

* serveral minor bugfixes and improvements

so long,

Hias

Source record: 22107

Hi can my Xformer (SIO-Printer port) lead be upgraded for use on high speed computers?

The lead still works on systems up to 166mhz Pentium 1 non-mmx, however i would like to utilize it on either my Amd k62-550 or Athlon Xp1900 systems.

Is there anything i can do to upgrade it to a SIO-PC lead!

what has to be done for using the second mouse key?? Do you have a
modification plan or sort of??

You have mentioned programmes, which us the second mouse button. Which
programms??

The 1010 uses a standard 9 Volt AC power supply just like the ones
used for 1050 disk drives. 31 VA means about 3.5 amps. There is
either the coaxial power plug (9 Volt) measured in mm (2, 2.5) for
size or the 7 pin mini-DIN plug (5 Volt) that XL/XE uses, but
'barrel-type' isn't much of a description to go on.

If your power supply jack fits the hole, and it says Atari on it,
chances are that it will work.

## 2295. looking for an assembler routine

Yep, it was written by a 15 year old Whiz kid named William Robinson. He used the Name "Dr. William Robinson" on Text Wizard to add credibility to the then, unique program. He re-wrote certain sections to meet Atari's specs but most of the code was from Text Wizard. Atari wanted to add a couple of more features, but William told them there was simply no more room to squeeze in any more code and still fit in the 16k Rom which was the largest the Atari 800 could handle without bank switching (which hadn't been worked out at that time) . When Atari found out William and his co-writer had buried an Easter Egg with their names in it in the code, Atari Sued them.. I think they settled out of court, but I'm not sure what the financial considerations were. It's tough to be sued by a major corporation Time-Warner when you are not out of High School.. "DANGER WILL ROBINSON--DANGER"!

Hi can my Xformer (SIO-Printer port) lead be upgraded for use on high speed computers?

The lead still works on systems up to 166mhz Pentium 1 non-mmx, however i would like to utilize it on either my Amd k62-550 or Athlon Xp1900 systems.

Is there anything i can do to upgrade it to a SIO-PC lead!

9v ac. Your brick is probably that. There are
a few that you don't want to use. The Indus
had a ps with the same connector, but it was 12v
DC, or 9v DC. The FAQ for this group, maintained
by Michael Current, has complete info on power requirements for Atari 8-bit
stuff.

# 2301. Re: Availability of MAC/65 Assembler cartridge?

Coaxial! That's the word I was looking for.

> If your power supply jack fits the hole, and it says Atari on it,
> chances are that it will work.

Now I have the info, I can't find the PSU, or the SIO cables. Typical. I'm sure it's 9VAC, and it's definitely an Atari branded one, I tried to sell it on eBay and didn't get a buyer. If the 1010 works, I can sell them all together.

Many thanks,

Alex Taylor.

It isn't safe. I don't remember the XF551 using a Tandon drive for sure but
the one it used was low powered compared to most Teac early drives I have
seen. The Teacs were really hard on the +12 V supply.

Unless you know it is a late model Teac or out of a laptop it probably isn't
a good idea.

Well, I remember replacing a friend's XF551's mechanism once, though I don't
remember the brand... the worst problem was that the connectors were reversed
(power connector on the other side of the data connecto, compared to the
original), so I had to place the casign upside-down (a better solution would
have been to use an extension for the ower cable, but that time there wasn't
one available). The drive didn't have any problems after that. So, if the
original mechanism is damaged, I'd say there's nothing to lose trying...

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

# 2319. Re: ST mouse converted to 8-bit mouse

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-11 13:34:24 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>
Message-ID: <b76ga0$6po$1@nets3.rz.RWTH-Aachen.DE>
Source record: 22132

Howdy Edward

> I was wondering if anyone has the information that tells how to do
> converte a ST mouse so that it will work on an Atari 8-bit. I
> guess Mathy Nasselroy did it. Anyone have that info?

Since I'm in a good mood, I'll forgive you for misspelling my name. I've
seen many variations before but this one is new. :-)

Check out STM18BIT.TXT on my site:

http://www-users.rwth-aachen.de/mathy.van_nisselroy/stuff.htm
(second file above "Some XEP80 stuff")

# 2320. FREE Atari stuff! Spring Cleaning!

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-11 14:18:51 UTC
From: Bravo Sierra Computers <atari@aracnet.com>
Message-ID: <Pine.LNX.4.44.0304110416540.7006-100000@shell1.aracnet.com>
Source record: 22133
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,pdx.forsale

This FREE Atari list has been and will continue to be updated. I've added and given away items already.This is aimed mainly at Atarians in Portland, Oregon USA. Gone are Hard Drives including both Atari MegaFiles as well as the Indus GT and both Atari 1050 Drives.The Atari 810 Drives still remain.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! Even if one person wanted to take it all, it would take several trips. It's more likely this job will be done by several interested parties. DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money!So, are you Interested? E-Mail Atari@aracnet.com or I prefer you call Ben at (503)256-9974.

==Text Below has been updated last on 04/11/2003 5:00 A.M. PST==

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==
===Ben===

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/
Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at
http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received
Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

# 2321. Re: Why did ATARI not use the 7800 GFX-chip for the XL ?

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-11 16:11:56 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3E96E94C.990C6EF4@students.uni-mainz.de>
Source record: 22134

Well,
the 7800 does not have the Pokey chip, meaning no sound, no
add-on-equipment to save any data (like floppies, tapes, harddisks,
etc.). Not sure if the PIA is inside the 7800. Anyway, I guess it would
be easier to install a Maria chip inside the XL/XE Ataris, than
upgrading the 7800 to an XL/XE compatible but improved computer...
-Andreas.

Hmmm,
afaik both mentioned games use Basic or compiled Basic. And both games
consist of more than 10 files, so it looks like none of them is what you
are searching for. But if you are interested, send me an E-Mail and I
will return the images of those games to you... greetings,
Andreas.

Source record: 22136

Well,
the schematics to use the second mouse button are on Mathy van Nisselroy`s homepage (that I do not know the URL right now). If you cannot find it, send me an E-Mail and I will send you a copy next week. There are 2 or more Minesweeper Clones that can use the second mouse button, one is Bombdown by Roemer of UNO (demo version with 2 levels can be found in many PD libraries and on many german magazines; full version was an ABBUC Sondermagazin or Jahresgabe). I forgot the other clone, maybe Bomb? maybe Mines ?!? maybe a different minesweeper clone (with a different name), I have to check it out... greetings, Andreas.

The failure mode on the one I tried was the 12V regulator would overheat and
shut down during any extended read/write operation.

Well,
here in Germany Atari also sold the XF551 with Chinon drives (that were
otherwise used as 5,25" drives for the Commodore Amiga)...
-Andreas.

Message-ID: <20030411205128.28234.00000661@mb-cj.aol.com>
Source record: 22140

Dear Atarians,

Last night I had a terrific time playing Atari 8 bit games over at Ben Smith's house. We try to get together regularly with other local Atarians and escape our responsibility ridden, stressful lives for pure Atari fun. I would encourage everyone in the Atari community to make contact with other Atarians in your area and set up a game night. It hardly costs anything (except perhaps for the chips, candy, and Mt. Dew) and it can be truly enjoyable. In my opinion the Atari community is the most helpful, loyal, and fun group of all the various computer societies.

Sincerely, An Atarian Forever

# 2328. Creative Computing Video & Arcade Games Magazine on the Web

The folks at the Classic Computer Magazine Archive are delighted to announce that the full text of Creative Computing Video & Arcade Games Magazine is now on the Web, at
http://www.atarimagazines.com/cva/

A short-lived spin-off from Creative Computing magazine, Creative Computing Video & Arcade Games magazine only published two issues, in 1983. But they were both packed with great information about home video games, computer games, handheld games, and arcade games. The magazines include reviews, guides to mastering games, and informative features.

Highlights include:

Who Really Invented The Video Game?
http://www.atarimagazines.com/cva/v1n1/inventedgames.php

Tokens Begin to Appear In Arcades
http://www.atarimagazines.com/cva/v1n1/spareatoken.php

I think many thousands of them got out in the first issue. I can't remember the exact way to trigger the Easter Egg, but it involved taking apart the standard Joystick and depressing 2 or 3 of the dome switches at the same time, Like left right and up simultaneously.. Something that can't happen when the stick is used normally. I remember Datasoft had a product that was a Joystick that used mercury switches and you tilted it in different directions to move in each direction. If you shook their "airstick" you could cause the Easter Egg to appear because several of the mercury switches could make contact at the same time.

I think the price was on the low side of what you could have gotten on ebay.
I think the shipping of $40 to $50 was a definite killer.

With the Atari you are limited to Composite video or Luma-Chroma, no RGB interface. I have no idea what the NES uses, but I'd be suprised if it had an RGB port as well.

I use a Commodore 1084 monitor with my 8-bit computer... with the luma-chroma interface.

Oh no I didn't mean that the system I bought for $10.49 was anything close
to what you were selling but just that on EBay you sometimes see 1 1050
drive go for like $70.00 US and the next time you see a complete system go
for $10 bucks.

Oh btw that 130xe and 1050 for $10.49 and both work great, the xe's keyboard
is kinda yellowed though. On the bottom of the 130 was a sticker from a
thrift store that said $3.00 LOL!

The most fun that I get out of the Atari line is being able to repair and
upgrade as necessary. Your system doesn't need repair or upgrading, so that
leaves me out of bidding on it. Electronic projects: I try to have a
different modification or upgrade in each of my Atari's so I go for the ones
sold as-is just hoping for another project to work on.

Have fun selling and thanks for the Auctions..

RoyE

All my CDs are guaranteed, just send them back and I'll make another set.
Out of all the CDs I sent out, you are only 2 people to have a problem with
them. I'm not sure who #1 was, but I sent him another CD already. I always
have troubles with the 2nd CD for some reason. It had the most files on it.

# 2347. Atari at UC Davis Picnic Day

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-14 11:01:47 UTC
From: bill@newbreedsoftware.com
Message-ID: <vywma.5461$JX2.376853@typhoon.sonic.net>

Cross-posted to: comp.sys.atari.8bit,rec.games.video.atari,alt.games.lynx

This past Saturday was "Picnic Day" [1] at the University of California, Davis (UC Davis). [2]

Picnic Day is a yearly event that apparently draws between 50,000 and 60,000 visitors. (It seemed to be a lot of high school kids and their parents, coming to check out the campus. ;^) )

I'm part of a local non-University computer club, the Linux Users' Group of Davis (LUGOD). [3] We decided Picnic Day would be a good day to hold one of our semi-regular "Hands-on Linux Demos" [4], where we set up a computer running Linux, put out a lot of hand-outs and flyers, and show off and answer questions about the operating system.

This year, the Computer Science Club at UC Davis invited us to actually come to UC Davis to be part of Picnic Day. (Since we're not a University group, we can't just go on our own.)

One of the things the CS club does on Picnic Day is put together a "computer museum." (One of the professors at UCD, Richard Walters [5], has a collection of old machines; from Altairs up to a NeXT Workstation.)

Anyway, the CS Club let us share some of their museum space with them -- I told people we were there showing the FUTURE of computing, rather than the past ;^) -- so I couldn't help but help out with the museum part when I discovered there were some Ataris in the collection.

I took a lot of photos of the museum, which are online at LUGOD's website:

http://www.lugod.org/photos/2003.04.12/

I brought my pair of Atari Lynxes and all of my games. (Carl - a pair of little girls really had trouble with Championship Rally ;^) They figured out Slimeworld, though.)

I also brought my relatively limited collection of Atari 8-bit game cartridges, since the collection had an Atari 800 and Atari 800XL.

When I saw what kind of monitor they were trying to hook the 800 up to (some Apple II style green-screen with no sound!), I rushed home and grabbed my Commodore monitor and a spare video cable. :^) By the time I got back, they found the right cables to get a TV/VCR combo working with the 800XL.

As you can see from the photos, all four Atari systems got quite a work-out. (An Apple II there got lots of attention from a fellow who seemed pretty good at BASIC on it, and eventually got his own Pong game written for it! See the last photo on the page.)

My favorite part of the day was when a kid (couldn't have been much older
than 10) quickly learned the controls to Star Raiders [6] and beat the game
(Novice level, I think), earning a Pilot, Class 4 rating. ;^)

I hope to help out with the museum next year, if I can.
I'll be sure to bring some more recent Atari 8-bit stuff, like
that killer NUMEN demo [7]. >:^)

The Commodore 1084 or Phillips CM833 (not 100% sure of its exact name) seem to be the 2 most commonly used and highly regarded monitors of the era, in fact the commodore 1084 is apparently the phillips re-badged. Both can handle RGB AND composite input, some models have stero sound.

Though considering the age of these, several comments i have heard suggest a monitor output to a scart/peritel or S-video tv rivals them in display quality.

I personly use a Commodore 1084 S, but i may have to pop the case on it and look at the speakers, i think i've torn the cones playing too much mule and now everythings fuzzy ;0)

Well,
here in Germany this is quite easy. AMC-Verlag produced some joypads
with buttons, called Multipad and Powerpad. They use buttons for the
directions, so one can press one, two, three or all four buttons
(directions) at once...

```
------------------
o O
o o o (Multipad with 4 joystick/joypad buttons, 1
Paddle and
o one fire button plus switches at the side of the
box)
------------------

------------------------------
O O (Powerpad with 4 joystick/joypad
buttons,
o o o o 2 paddles, 9 "numeric" keys, 2
control
o o o o o o buttons and 1 fire button)
o o o o o o
------------------------------
```

Alas, since Armin Stuermer (chief of AMC-Verlag) died in 1998 these
items are no
longer available... -Andreas.

That's just called Bad Management. Never hire any clowns that have "Manager for Atari" written on their resume, as they are nothing but idiots. Any company who has a good management team can weather just about anything. Atari started out with good people and a good product. Then a bunch of orangutans came in and started tearing the place apart. The good people left and only a bunch of monkeys were left to manage it.

I am not good on Atari History, but if I recall correctly... the guy that started Atari left out of disgust for what was going on and began another successful business called "Chuck E. Cheese's". The clowns that took over eventually moved our USA jobs abroad somewhere, laying off the entire Atari staff in California (I think that's where it was at). Then they sold the company a couple of times, majorly screwing it over each time. I think Hasbro had it last, and it may have closed down the "Atari" department all together some time in the last few months as I seem to remember reading something about it.

All this sound about right?

Any good management that has control of a company that was successful enough to sell on the New York Stock Exchange would have kept up with the times. If necessary, build a 16-bit machine, or a 32-bit machine. Make a deal to make it compatible with IBM somehow. Hell, if they are smart enough, make a 16 or 32-bit compatible with both an IBM and an 8-bit Atari, make it backwards compatible. That's what gave IBM the extra edge that it needed, backwards compatibility.

If Atari had not been taken over by the idiots, I imagine they would have a product line similar to the Playstation or the X-box and a few other systems to keep up with the times. Atari did not like advertising and marketing for some reason, and it was Apple that got the contracts with the schools (at first), and sold their systems to the local schools. Nice deal... another failure for Atari though.

Atari was an excellent machine. It was nice having different systems out, preventing the IBM and Microsoft Monopoly that we have now (but probably instrumental in paving the way for the monopoly). I enjoyed the games, and machine language is much easier to work with for an 8-bit too. Atari rarely crashed and one hardly ever heard of a 'virus' for an Atari.

# 2352. Re: Burning a ROM file to a cartridge

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-14 19:19:52 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <sRDma.24684$4P1.2214719@newsread2.prod.itd.earthlink.net>
Source record: 22065

Theoretically a ROM was a cart and the file is an image of the cart; it
should be fairly straight forward unless it was a special or banked cart.
The normal 8K carts were .ORGed at $A000 to $BFFF and the 16Ks were at $8000
to $BFFF. Disk and cassette software often loaded in low memory and are more
difficult to run from a cart in the $8000 to $BFFF range.

I think it was a little high myself.

I looked at it but luckily won one that was only $32 for a 130XE and 1050,
and 410 Casette recorder. Plus the hidden bonus was the 1050 had a Happy
Upgrade in it! ;)

Woohoo..

I use flickering (a different kind, though) in Gem Drop. Works pretty
well, since it can dither horizontally. (e.g., there's less striping than
in APAC or ColrView modes, though obviously far fewer colors available)

Well, what do you know! I just looked at the back of my commodore 1084
monitor and sure enough, it *does* have an RGB port! I stand corrected. I
never really noticed it since I never use it.

LOL! and I have two of them, and an older grey/black commodore monitor in
the garage. I may be selling one of my 1084s soon though. Anyone know
what they are worth? It's not the stereo model.

Hi John, I have two Commodore 1084s and a Commodore 1702. I am very happy with both. I'm a big Commodore fan. Can you say that here? They both have great pictures. The 1084 is a higher end more flexible monitor. You can usually get either one on eBay for about $75 to $85 (S&H included) for monitors in good shape.

# 2358. ATARI made first contact to USB

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-15 09:02:07 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <b7ghqh$m9hj$1@ID-174234.news.dfncis.de>
Source record: 22071

Yesterday we made "first contact" with the USB Controller, we are now able to talk with the USB Controller from the ATARI and starting the driver development.

We're still far away from any serious application.

We will post the USB-Device-Driver-Development-Kit-Disk (UDDDKD.ATR) :) in a few days with more information on the project homepage in the APG Wiki:

http://www.strotmann.de/twiki/bin/view/APG/ProjUSBCart

Credits:

* Guus Assmann Idea and main design
* Marc Brinks has completed the cartridge (put everything together)
* Thomas Grasel and Harry Reminder found the last bugs and made the needed modifications to the cart

Umm.... Not always. Sometimes you just can't avoid things going
pear-shaped due to market forces or economic situations. Good management
can last longer but they can't avoid the inevitable. Also, hindsite is
very useful to see where a company went wrong.

> I am not good on Atari History, but if I recall correctly...
You recalled most of it fairly innacurately I'm afraid!

In a not so near future, yes, if...
* the used USB controller (on the cart) can be operated in Master/Host mode
(we don't know this)
* the USB Sticks have some kind of standard USB protocoll (we don't know
this)
* the ATARI ist fast enough for USB communication with an USB stick (we
don't know this)
* we have enough ram to implement the USB-Storage protocol (includes full
FAT16/32 filesystem support)

There is a lot, lot work ahead of us before someone can _use_ USB on A8.

But we do our best....

Regards

Carsten

Yeah, some software could be copied with the Happy but would only run on a
Happy drive. It was only a few that would do that IIRC (from the Happy
rev.7 docs.)

Almost all software is now available on the Internet in cracked form....
what are you looking for?

I think the protection required the programmability of the happy hardware to work. I think the pre-defined backups were either parameter files (for the hardware), or 'told' the hardware how to make a successful copy. I'm not sure since at the time I couldn't afford a happy mod. :(

The folks at the Classic Computer Magazine Archive are proud to announce that Tandy Computer Whiz Kids comic books are now online.

http://www.atarimagazines.com/whizkids/

Published sporadically from 1984 until 1991 and distributed for free at Radio Shack stores, the Tandy Computer Whiz Kids was a series of comic books that featured kids engaged in exciting adventures, information about the world of computers, and frequent mentions of Radio Shack products.

The site currently has the six complete Whiz Kids issues, and we are looking for collectors who have other issues.

Launched in 1996, the Classic Computer Magazine Archive offers full text from Antic, STart, Creative Computing, Creative Computing Video & Arcade Games, and Hi-Res magazines, as well as information from Compute! and Compute!'s Gazette.

I have always viewed the Atari history with the Tramels (I don't think the spelling right, but....), as being a day late and a dollar short. I REALLY believe that their management believed that the computer industry would continue to respond to tough talk and threats of court cases. That may work when you're selling 100,000 C-64's a month, but when you're Atari, you need to treat vendors and software manufacturers good. Selling development systems at list price to software houses when you are trying to get a machine off the ground is NOT the way to get them to support you. Selling machines to your loyal user groups at list is NOT the way to get them to continue to be loyal.

Where the Tramels went wrong (in my opinion):

1) 8 bit development. By 1986 the 8-bits were on their way out, BUT, I would have done a redesign like a mini apple IIe, and stopped there. Maybe make a card or 2 but let hobbiests and manufacturers take over. A peripheral manufacturer LOVES it when YOU supply the power supply, shielding, and case for THEIR product.

2) The Federated Stores. C'Mon, what were you thinking?? What they should have done was 'do it like DELL', before there was a Dell. At the time I KNEW there were problems just by reading Analog magazine and hearing about them selling computers at Federated, Mail order, Computer stores, and retail outlets and I was thinking "who handles the pricing and shipping schedules for all those folks", and sure enough, there were stories of shortages and price wars.

3) Pushing the European Sales. Jack, Jack, Jack.... the US is/was the largest economy.....I know you probably made more money selling in Europe, but quantity would make more people buy (people bought C-64s just because their friends had them)

4) The Mega ST. They made an ST smaller and added a blitter chip. The Atari 1040ST wasn't too bad size wise, so IMO the Mega was a waste of resources since it didn't push the technology forward at all.

5) Not selling the STBook. Geez... harden up the case a bit, and it would have been a leader.

6) Since they liked vertical markets (music, DTP), they should have released that ST Tablet of theirs. They would have been about 5 years ahead of the tablet leaders and about 12 years ahead of Microsoft and the folks now.

7) The Jaguar. GREAT idea, but 4 processors in one machine? I think handcuffing an octopus might have been easier...

Well, thats all for now.

Tony

I couldn't afford one also! I just got a 130XE w/ 1050 and as a nice hidden
bonus the drive had the Happy mod!!! I am just playing with it as I was
always curious about it. I can get all games on the net so this isn't an
issue.

Rev 5 S/W doesn't use the PreDefined Backup. If you can run it without the PreDefined Backup, or find a way to run Rev 5 S/W, even if it means switching to Rev H/W, that should fix it.

Hey dude, why not use Chipmunk, a deprotector?

It has a sector copier program which copies the unprotected sectors, and
then a parameter's disk which makes an adjustment to the newly copied disk
that deprotects the program for good....you can now make as many copies from
the newly deprotected disk with a normal disk copier.

As far as I know all programs are supported. I have chipmunk verion 3.04 and
the list of programs it can copy&deprotect looks very complete to me.

Let me know if you'd like an .atr image of chipmunk.

My rtdos account (rtdos@yahoo.com) on yahoo (and the groups I had) no longer exist. This includes my webpage. :-(

Apparently they got to me before I could shove it up their arse. Anyways I will be looking for a new place for my website and will let every one know in due time (this time not until it is ready for public consumption).

My new webpage will somehow be dedicated to rtdos and the many classic systems as well as a tie in with my groups on MSN (unless I can find a good website / chatsite combo package really really cheap).

Take care guys and have fun...

(I think I'll get back to lurking now)

> There is a lot, lot work ahead of us before someone can _use_ USB on A8.

But at least it's being worked on! It's *amazing* how much 8 bit computers are advancing lately. The C=64/128 was way ahead with the CMD Ramlink and hard drives, then Cloud-9 started developing the CoCo 3 Superboard and paul Barton started working on a 64 Meg board, then Contiki, and now this!

> But we do our best....

Keep up the good work! I have no doubt that it can be done. Remember, they also said they couldn't do TCP/IP, and that's almost done.

## 2386. XEP80 and "Scan Rate Doublers"

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-17 22:56:48 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030417185648.19055.00000057@mb-m12.aol.com>
Source record: 21949

Has anyone successfully used an XEP80 and one of the "Scan Doublers" that allow using the A8 with a VGA monitor (JAM!!, Instant TV, All-In_Wonder, etc.)?

I have not been able to get either of my XEP80's to work with these things. The "doublers" do a very good job with the software 80-column drivers, but so far, no luck with the XEP80. In some cases, I get just a few horizontal lines, and in the best of circumstances, I get maybe a half-screen (the bottom half of the screen) of actual picture. The fact that it is the bottom half probably means something related to the sync. (?)

I have not found any mods for these things, and there are no hardware adjustments in the XEP. Does anyone have an idea what's going on here?

Thanks,
Larry

I don't think Alpha radiation or Xray could do any harm in small doses
(zaps), Gamma radiation could (like the sun). What I would be worried about
are metal detectors that might use a magnetic field.

Dont wrap it in aluminum or mark special instructions on it. That will lead
to suspicion and them opening it up and having a look see. 8-)

I thought it worked fairly well through my Cheese Box. I only tried it
briefly, but as I recall the resulting output didn't quite include the entire
display area of the XEP80 but it was close. And the clarity was quite good.
(I needed to get into one of my old AtariWriter 80 documents.)

Source record: 21962

Does anyone know where I might be able to find the old Action cartridge in a format that will run on emulators? I still have my original cartridge, but I'd like to be able to use it on my Athlon system.

## 2400. A rare opportunity(?)

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-19 01:03:22 UTC
From: Phillip Saunders <PSAUNDERS3@triad.rr.com>
Message-ID: <uf1oa.12042$pr.1793658@twister.southeast.rr.com>
Source record: 21963

I realize interest in Atari computers is waning, but from scanning through the posts here, there are apparently a few die-hards, or perhaps collectors, who may be interested in a variety of 8-bits and peripherals I have that are currently just gathering dust. This includes a 400, an 800 or so, 4 or 5 800XL's, several 810's and 1050's, 410 tape recorders, 850 interface boxes, etc., some cartridges, lots of disks, and some Atari oriented magazines. Some units may not be fully functional, but the majority are in good shape. There is also a 520ST, anXEGS, a 5200, a couple of 2600's, and several game system cartridges. I've just run out of time and space to do anything more with them. I don't want to fool with E-Bay, etc., but like anyone else, if I get even a little bit of money out of them, I'd be tickled, so of course, the best offer wins. (Sorry, package deal only at this time!) Otherwise, anyone that is willing to pay shipping (from central North Carolina) before I have to (shudder) dispose of them is welcome to them. This is a very limited time offer (Spring cleaning, you know). My apologies, for such a long post, but thought everyone would be interested in at least a little about what's available!

## 2401. 1050 repair and memory upgrades.

Bill,
Check out this web site:<http://www.atariprotos.com/personal/john/roms.html>
or
<ftp://atari8@atari.xs4all.nl/Roms/Cart%20Dumps/Cart%20Utilities%20Roms/>.
I use the Atari WinPlus 3.0 emulator with the cartridge image. Any
question - let me know.

I would do what I have done. Just buy a video converter and a
Commodore monitor cable. Then you could hook up any SVGA monitor
to your 130XE. Works great at my end.

Hi Bill,
<ftp://atari8@atari.xs4all.nl/> Try atari4ever as the password and
atari8 as the user name then check out the Holmes archive utilities.
Lots of Action info, tutorials etc. :)

This is also in response to your other post on this site requesting
Action info.

Regards,
Kvan

## 2413. Galaga for A8?

Snipped a load of foul homopobic crap..

I think you should see a doc, there's an awful lot of repressed homosexuality there which just needs to get out properly. Perhaps outing yourself may help you, maybe even your colleagues in the IT dept will accept you once they see the true you.

There's nothing wrong with you buying muscle & fitness but pretending it's about you wanting to go to the gym to your friends is pure denial, just look at those pictures of oiled men and feel that stir in the trousers....It's nothing wrong.

Also I know that it's difficult for you trying to live a lie, having a girlfriend (if you were able to find one) is awkward when you actually like her brother more than her but if you come out of the closet all will be solved.

Of course, all this could be down to the way your Pop reared you, you see, those that shout the loudest normally have the most to hide.

Eh sweetheart..

# 2419. New eBay Atari auctions

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-20 16:59:10 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1050858010.62699.0@doris.uk.clara.net>
Source record: 21982

Hello All,

I've just started a new auction for a copy of the book: 'Advanced
Programming Techniques for your Atari
Including Graphics & voice programs', by Linda M. Schreiber. Published in
1983 by Tab Books, Inc. 207 pages.
ISBN: 0-8306-1545-8.

I also have a very rare copy of issue 1 (from 1984) of 'User Guide to
Microcomputer Software - Software Index'. This was a general 80's UK
magazine, which was actually a monthly software listings and review
magazine, which covered all the popular micros of the day, including the
Atari 8-bit. Well worth a look.

I also have some Atari disk-based software on there with starting bids of
just GBP0.99 with no reserve!

The link is below (this will split on to two lines, so please copy both
lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangar

Sure is. You can get one reasonable priced at www.avtoolbox.com (look
at the upscalers area). I have the AVT-3340, and it works great.

On the flip side and original post topic, I have a Magnavox Color
Monitor 40 that is in decent shape (on/off button sometimes has to be
pushed more than once to turn off) that I'm willing to get rid of for
just the cost of shipping.

Okay, thanks! Galaxian will have to do!

It's for my girlfriend... she likes the games on my 800XL but is clueless on how to use it, so I thought I'd try and get cartridges of her favourite games instead of disks.

Thanks again!

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail me or call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.
---------- Forwarded message ----------
This FREE Atari list has been and will continue to be updated. I've added and given away items already.This is aimed mainly at Atarians in Portland, Oregon USA. Gone are Hard Drives including both Atari MegaFiles as well as the Indus GT and both Atari 1050 Drives.The Atari 810 Drives still remain.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! Even if one person wanted to take it all, it would take several trips. It's more likely this job will be done by several interested parties. DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money!So, are you Interested? E-Mail Atari@aracnet.com or I prefer you call Ben at (503)256-9974.

==Text Below has been updated last on 04/11/2003 5:00 A.M. PST==

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors,

I will sell and Ship them within the United States! For Collectors like
Atari Museums and Private Collectors!Only Serious Buyers need make offer!
Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives,
as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==
===Ben===

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/
Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at

# 2433. Journey to the Planets (Oh, no! Not again!)

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-21 16:08:35 UTC
From: lbaeza@usa.net
Message-ID: <c860ca33.0304210808.7fb22b78@posting.google.com>
Source record: 21996

Hello Everybody

This weekend I had a bad flu case,
so all I could do was stay in bed, watch TV and play with my Atari.
I was determined to end that Journey to the Planets game,
you know, that game where you go to planets to steal stuff and so.
After I completed all the planets (!), went back to my planet,
picked up a candle or something that looked like it,
and I was abducted by my own UFO.
Then I went to outer space and flew all over the place,
no planets at all, only stars.
Suddenly I found out a blue planet, reduced my UFO speed,
but when I touched the planet, PRESTO! It disappears
and everything is only stars again, until I flew all over
the place and then again I found this little blue planet.
The I slowed down my speed again and, when I touch the planet
with my UFO, the planet disappears!

Is there an ending for this game?
Somewhere I read about a planet with others UFOs like mine
that have landed all over the place...but no UFOs at all!
Just this little blue planet that disappears when I touch it!
This is a little frustrating...
Any info about this subject is appreciated.

Regards

PS: English is not my primary language, sorry about it...

Hello Bill,

here is some sample code:

http://www.strotmann.de/twiki/bin/view/APG/LangACTION

* ActionSysRuntimeOss - Original ACTION! Runtime Source
* ActionSysRuntimeAlt - Alternative ACTION! Runtime Source, Peter Finzel
with addtions from Carsten Strotmann
* ActCompileToDisk -- An ACTION! Source from OSS to compile ACTION!
Programms for Disk-Boot (not testet, please give
me feedback if and how this works)
* CrcCheck -- CRC and length check, written in ACTION!
* TrackBall -- Code for using a Trackball or ATARI ST Mouse
* ActionCStings -- 'C' Style Strings in ACTION!
* ActionDli -- How to use Display List Interrupts in ACTION!
* ActionVTFiveTwo -- VT52 Terminal Emulator written in ACTION!
* ActionXModem -- XModem Filetrasfer Protocol driver/programm in ACTION!
* ActionLocalStack -- Local Variable Stack for ACTION!
* ActionChartest - a group of routines which perform various functions
and tests on characters. (orig OSS)
* ActionIORoutines - IO Routines (CIO and SIO)
* ActionPlayerMissile - Player Missile Routines
* ActionFunctionPackage - Collection of useful small Routines
* ActionWindowingRoutines - Windowing Routines
* ActionFastGraphicsEight - Fast GRAPHICS 8 Routines
* ActionFastGraphicsFifteen - Fast Graphics 15 Routines
* ActionOSVectors - OS Vectors (XL Rom)
* ActionWrite - Fast Screen-IO
* ActionFileSelectBox - A Fileselect Box
* ActionStringRoutines - String Routines
* ActionBload - Binary load (COM-Files)
* ActionFontLoad - Font Load Routines
* ActionMPAAnimation - Multi Player Animation Routines
* ActionMouse - Routines for ATARI ST Mouse
* ActionComLoad - Shell for loading COM-Files
* ActionLoadDL - APL Display List Load Routine (see ActionAPL? - Antic
Programmin Language)
* ActionDosSetup - Setup Batch Language Tool for loading file into
Ramdisk upon startup
* ActionXFDTrans - Single Density Disk to XFD File (for PC XFormer or

other Emulator) Transfer Utility
* ActionDeleteEol -- Delete EOL-Char in Textfiles
* ActionPicMirror -- Mirrors ATARI-Pictures
* ActionKoalaPicLoad -- Load Koala Pictures (Library Routine)
* ActionRainbow -- ATARI Rainbow Effect in ACTION
* ActionIoRoutines -- Some IO Routines
* ActionFastGraphics -- Some fast graphics routines

I agree. Although the BIN may be a little high, the starting price is
very reasonable. I just bought a Castle Hassle for $76 on ebay.

Some of these, you just don't see very often.

## 2436. Sparta DOS version confusion?

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-21 21:30:19 UTC
From: john@jrcc.net
Message-ID: <de16c5ec.0304211330.7ba374ed@posting.google.com>
Source record: 21999

Hi, I am relatively new to Atari 8bits. From what I've been able to tell Sparta DOS seems to be the DOS of choice. I am seeing conflicting documentation on which is the latest version of Sparta DOS.

I have seen references to Sparta DOS X (which I assume is a roman numeral 10), and Sparta DOS 3.3. Which is the current version and does anybody know where I can get a copy of it? Also, can I get a copy of the documentation electronically, either on the web or via e-mail?

Thanks,
John@jrcc.net

# 2437. real strange video problem with both my 130XE's

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-22 00:52:52 UTC
From: Christopher Lang <chris_XNOSPAMY_topher.lang@plus.cablesurf.de>
Message-ID: <b8240h$i7l$1@news.gatel.net>
Source record: 22000

Folks,

I have a real strange video Problem with both my 130XE's (PAL). Have a look at this picture:

http://chl-informatik.de/images/image-20030422-024043-000.jpg

Whenever I use an YC (or SVGA) cable I get this distorted picture. Using a composite Video cable is fine. I started measuring with an oszilloscope and found that this distortion seems to be on the color signal on pin 21 of GTIA.

Usually the video quality should be best with an SVGA cable not worse than with a composite cable.

Did anybody else see this video problem on an 130XE and does somebody know how to fix it? I tried to, but didn't succeed...

thanks!

Chris

# 2438. Re: Sparta DOS version confusion?

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-22 03:25:50 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <va9dheb06t121e@corp.supernews.com>
Source record: 22001

SpartaDOS is my DOS of choice, along with MyDOS
4.53 for use with imageman on the PC.
3.2D was the last disk based version from ICD, the
original company that made SpartaDOS.
It had some bugs in it.
3.2f and then 3.2g were released after Mike Hohman
bought ICD rights to most 8-bit ICD products.
Those two were shareware, you were supposed to
register them.
The 3.3 ones, a, b, and c, are somewhat difficult to
determine rights/ownership. I think 3.3a is available
on the net. 3.3c is especially good for BBS Express
PRO, both (3.3c and BBS Express PRO) are still
sold (by Video 61) and not shareware or pd.
Video 61 also sells a 3.3c cartridge, and I believe
Video 61 has rights, or claims rights to 3.3a and 3.3b.
So, the bottom line is 3.2g is the, I think, undisputed
freely usable/shareable latest version.
SpartaDOS X is not '10', it is 'X', and is up to version
4.22 or something. It is strictly a cartridge DOS, it
was the last made by ICD (4.20 I think). FTe made
some improvements (4.21 and 4.22), but FTe isn't
any longer available to buy SpX from.
The only way you can get SpX is to get a used one
(maybe some people can burn them, but I don't think
that is much available, if at all.)
I have SpX (4.21 I think). I rarely use it, the high speed
routines built into it are unreliable for writes on my
old disk drives. SpX is the best DOS for hard drives, but
MyDOS is the DOS of choice for some for hds as well.
But I ramble.

Sadly fancy endings or even an ending were pretty rare in early 8bit
games, most were like arcade cousins which were high score based.

I remember the hassle of getting thru Spelunker all for 1 ordinary
screen (was glad to see it tho). It wasn't till recently I saw the end
for Montezuma's :-)

At least there was an end screen in Spelunker. At Montezum's I never
saw an end, even though I drew a map to make sure I didn't miss a
single room. I ran around for some time through the 'chamber of the
stomping god' and the adjacent rooms and then gave up. Did I miss
something is there a more complete version than the ones I got ?
BTW, I think I even tried to get back to the top but I'm not sure
since that it's more than 10 years since I played it.

Gerhard

Year's later, a Cart version of Montezuma appeared that had something
like an ending, though without the god. In the first (beta) release
of Montezuma, no ending exists, and some rooms are even buggy, esp. on
the right bottom side of the pyramid. (I remember a ladder you cannot
climb up again, trapping you in this area).

Note the ":-)" above.

Greetings,
Thomas

>Yes, this is the ending. That's all where I got, too.
Damn! That's FRUSTRATING! I thought I had a corrupt binary program
or a faulty copy of JTTP...

> I remember the hassle of getting thru Spelunker all for 1 ordinary
> screen (was glad to see it tho). It wasn't till recently I saw the end
> for Montezuma's :-)

Hey! I am playing Montezuma ("Preliminary Monty 16K Pirated Hooray by
Sherlock Holmes") since when? 15-20 years ago? Still no ending, I keep
passing levels
on and on and on...
I know Montezuma's Revenge has an ending, but not the one I play (BTW
Montezuma is my favorite game of all times).
How do I finish Montezuma? Killing all the lives I have in stock? ;-)

Regards

on the same subject (almost) what about the bbs doors (with action source code) that used to float around for the likes of BBS Express Pro (and other BBS programs)?

when they were both dial up access (before Netscape & Internet
Explorer ever existed)?

does anyone still have their users guides or manuals (esp. chat) to
'em? I'm looking for info on the chat rooms (like protocol, chat
strings, chat commands, etc.) i'm working on an "article" of sorts
for a state telecommunications newsletter and i need this information
for comparative purposes.

For example, I know in Delphi the command "/ROLL" would simulate the
rollowing of the dice and "/INVITE" or "/IGNORE" etc.

How'd compuserve handle real time chat ?

Ahh, those were the days. I have this big manual for Delphi
around here somewhere. Give me a few days and see if I can find it.
(I have no clue where it is right now....)

Old avalon hill basic game----"galaxy" slow tedious game, but certainly has much memories associated. If anyone potentially knows where I can get it/download it/etc., please email me at jzajchowski@yahoo.com.

I'd like to get the game for my PC if possible.

Thanks for reading!

Don't know about Delphi, but Compuserve had the 'CB' simulator which was the chat program. It was alot like IRC today with 'channels' instead of rooms and you could go one on one as well. I don't remember any special commands.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I'm trying to remember the ending I saw, was a definite ending as you
got to a room with LOADS of treasure after falling down for a while.

Seem to remember the room colour cycling, maybe with Well done or
something like that. There's a SLIM chance it could have been the C64
version I saw but iirc they were done by the same team.

I shall recheck and if it's the Atari one I'll slap a jpg of the end
on my page and let people know.

Yup, that's the ending of the cart version. It doesn't have a montezuma,
but a three-story room with each of the floors locked by a grey door.
You could open these (provided you found the key), and then perform a
diagonal jump, leading you to bottomless rooms with treasures. You could
collect them and would then be advanced to the next level.

Greetings,
Thomas

Hello

I need help on the name of the following game for the Atari 400/800/XL/XE:

In the game you control a tank.
When you win the game, a picture of your tank on a hill
with a big moon behind is shown on the screen, with stars.
When you loose the game, a skull with crossed bones appears
full screen, with vibrating colors.

Any help on the name of this game will be appreciated.

Regards

From: Tim <tjlazer@mail.com>
Message-ID: <vae6oehksq4da0@corp.supernews.com>
Source record: 22024

I am also looking for a game for the Atari 800. It is a space shoot'em up kinda like Lifeforce. I can't remember much about it but it was a great game. You controlled a ship in different levels much like Lifeforce but the graphics were 8bit, must of been a cartridge game.

Any ideas would be great!

Thanks
Tim

Why is it that Galaga, one of the most successful arcade games of all time, never had many home versions? I don't believe there was ever an official C-64 version either. What official home versions were there? I know there was a 7800 version and maybe an NES version but that's all I am aware of.

I have an Atari Portfolio Smart Parallel Interface. It comes with file
transfer program . The intructions says that you can print from dos or
from the internal Portfolio to a printer.,send and receive files between
Porfolio and IBM computer. If your interested let me know.

.....

The SETUP menu has a little transfer program built it. You can use it to transfer a better program over using the parallel interface. I use hyperterm on the PC side.

There are other options...the pofo card reader that connects to a really early pc with DOS. Not windows!

Using a driver that lets you connect a 100meg zip drive for huge storage. I hook mine to my pc, transfer the files over, then hook it to the pofo. Actually, they are cheap enough I have two. Its fairly simple to do. I am creating a zip disk/cd/memcard combo with about 40 megs of pofo sotware. The driver is obtained elsewhere.

Actually, the chat is three days a week, actualy topics vary:

8P C(but I think the host wanted to start at 7P C), Wednesday is C64,
attendance is low.
8P C, Thursday is Atari, attendance varies.

10A C, Sunday is Atari, attendance varies. Started for our European
friends.

People come and go at different times, mostly 30 mins or so after start,
some only stay a minute or two.

First thought, you are plugging the YC cable into the luminance/chroma inputs,
try swaping the phono(?) connectors around.? Display is for PAL? Not all 5
pin din cables are wired the same.

How about a toroid such as those used on RF cables?

Since its both, I guess I rule out the power supplies.

I don't know yet how hard a mod is, I have an adapter that works 95% with an ST color monitor. I think that there are some composite to RGB adapters.

My first guess is the (regular monochrome monitor version)XEP80 is confusing the doubler by generating 640 clocks per line for 80 column text . More than a standard TV. The software 80 col uses the standard or less TV clocks per line, about 282 I think, so its fine.

If you have the XEP modified for a standard VGA output, then I have no idea. Would have to use an oscilloscope to look at the XEP output.

## 2484. XF551 for trade:

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-24 08:57:16 UTC
From: misterbumpy73@wmconnect.com
Message-ID: <20030424045716.18865.00000505@mb-m03.wmconnect.com>
Source record: 21847

I have an XF551 (a little discoloured but works fine) that I'd like to trade for an older drive like a 1050 or 810.

Before you all think I'm crazy, it's for compatability purposes (like Bank Street Writer and a few others). There are a few apps I like that boot up just fine with other drives, so I'd like to make a swap if possible.

Anyone out there interested? I'm in the U.S. for shipping.

Thank you so much for the offer, but it was "Titan" I was really
searching for. I must've spent two weeks typing it in when I was a
teen! Softside didn't have the typo-checker like ANALOG and some
others did, so it took forever to figure out where I had goofed!
Thanks again!

Hello James, I'm sorry to see the Anonymous Terrorist is picking on you.
I've been ignoring him. The best thing to do is ignore it. If everybody
ignores the Troll, it will go away. It feeds on controversy and replies.
Read the following and think of them as suggestions or rules.

1) If you must reply to the Troll, don't include a copy of it's post.

2) Don't continue it's cross posts. It just wants attention.

3) The best thing to do is just ignore it and it will fade away.

Hi Rick-

> If you have the XEP modified for a standard VGA output, ... <

Thanks for the reply. "modified for standard VGA output..." -- I've not heard of that before. Do you have any info, or are you perhaps referring to the Bob Woolley mod for TTL digital output? (I don't think that would work with VGA.)
Larry

# 2488. FREE Atari stuff! Spring Cleaning!

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-24 11:47:39 UTC
From: Bravo Sierra Computers <atari@aracnet.com>

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.
---------- Forwarded message ----------
This FREE Atari list has been and will continue to be updated. I've added and given away items already.This is aimed mainly at Atarians in Portland, Oregon USA. Gone are Hard Drives including both Atari MegaFiles as well as the Indus GT and both Atari 1050 Drives.The Atari 810 Drives still remain.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

==Text Below has been updated last on 04/11/2003 5:00 A.M. PST==

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer!

Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives,
as-is as well as parts/incomplete SF354/SF314 Disk Drives.

All I see is a request to install Flash V6. Obviously by someone who
can't construct a website using HTML. And if I do bother to install F6
I bet the creator has forgotten that most of us are not broadband
users and really can't waste time downloading a few MB of... whatever
it is we're being asked to check out in good faith.

Would someone who has seen whatever it is please post a few lines of
text describing it (perhaps it's a flash animation?). Feel free to use
CAPS for the loud parts and exclamation marks for the climax. :-)

BTW, ANY Flash animation is put in the shade by George Lucas' "Star
Wars - Episode 4" recreated as an ASCII animation in a Java Applet::
http://www.asciimation.co.nz/

But even that's topped by this:
http://www.cnnnn.com/cnnnn/news/s697721.htm

Well,
I have two versions of this game: one has a length of 98 single sectors and is named Titan (without any docs), the other version has 144 single sectors and therefore I named it Titan 2 (it comes with english docs). both games are written in Atari Basic. Besides, some redundant information: there was also a type-in listing in the german Atari magazin, that was named Titan. It was a ML program (clone of Caverns of Mars, but extremely hard)... E-Mail me, if you are interested. Last not least, I have collected as many of the old Softside programs, that I have found so far (one or two disksides). -Andreas.

Source record: 21860

Well,
this is not only the ending of the cart version of Monty (which is
besides an un-official version!). It is the ending of the official 16k
version released by Datasoft (Disk), Databyte (Tape) and a few other
firms. Otherwise said: there are two version of Monty - a) the longer
one which features a man with a sombrero and many strange bugs
(filelength approx. 32-37kbytes), as well as a nice intro screen and
intro-music but no possible ending (one cannot deafeat the indian
montezuma). and b) the shorter one which features Panama Joe (wearing a
smaller cowboy hat), no intro screen, no intro-music, (almost) no bugs
and a filelength of approx. 16kbytes. This short version has an ending,
where you can collect many treasures (diamonds). Because of its filesize
it was an easy task to put this shorter version on a cartridge (but
official versions were only available on disk and tape)...
-Andreas.

Well,
here in Germany you can still buy "Commodore" items in various
super-markets. These items are mostly for the PC (and other things) but
do have the original Commodore logo/label. for example big supermarkets
like real,- , metro, and others sell CD-Rs, CD-RWs, Diskettes,
Telephones, Scanners, etc., etc. with the Commodore logo. Think they
have bought the rights to use this logo in the 90s, so I am wondering,
that Commodore should be back again...?!? -Andreas.

It's a spoof Al-Jazeera style news item, with the Iraqi information
minister acting as Commodore spokesman. Excerpts from the subtitles:

... rumours of commodore going bankrupt are examples of lies by the
infidels ... c64 is the mother of all computers ... etc.

At the risk of sounding like some kind of Flash apologist, I cannot
think of any other inexpensive way of combining a video background with
dynamically generated text and dynamically inserted images - the site
allows you to create your own page by supplying your own subtitles and
images.

Without using Flash, you'd have to generate the video files server-side
(either on the fly or once only) which would be rather expensive either way.

Regards,
Kieran

PS: Flash is proprietary, but the specification is available - see
<http://www.macromedia.com/software/flash/open/licensing/fileformat/>

# 2503. OT Arcadia game consol

Figured I would ask here since there are people as old as me.<grin>

Just saw an Arcadia game machine. Not to be confused with the game of the same name which swamped all my searches when I was trying to find out what this thing is.

It appears to be a projection skeet shooting game with 2 lenses and a cart port on the front. Does anyone have info on this like controller types or if there is a built in game?

Unfortunetly not many of the Action! module authors made their
source code available. Are you interested in developing a new online
game module? If so, I'd be happy to collaborate and help.

As I've said in another posting:
<URL:http://www.theinformationminister.com/main.php?ID=612201614>

This bypasses their Javascript form submission code and their Flash 6
detection.

> And if I do bother to install F6 I bet the creator has forgotten that most
> of us are not broadband users and really can't waste time downloading a few
> MB of... whatever it is we're being asked to check out in good faith.

Not megabytes at all; the Flash applets are quite small. It doesn't take too
long to fetch them even on dial-up.

> Would someone who has seen whatever it is please post a few lines of text
> describing it (perhaps it's a flash animation?). Feel free to use CAPS for
> the loud parts and exclamation marks for the climax. :-)

On a background of a C64 advertisement: "It's not how much it costs, it's how
little you get" (or something), we see Mohammed Saeed al-Sahaf saying
something and waving his arms a little. It is subtitled as follows:

"Today I am the new spokesman for Commodore International. Praise Allah!

"Rumours of Commodore going bankrupt are lies by infidels! I show you in one
hour.

"C64 is mother of all computers, better than 20GHz. This is incredibly true!"

I'll leave those of you who've installed Flash to view ID=612216464 for
yourselves...

So you are saying there are actually three versions?

1) Utopia's long version
2) Preliminary Monty 16k cartridge version (pirate)
3) Montezuma - 16k official release

If so, can you send me version 3)?

thanks,

Some of the later issues had a STOMP table similar to Antic's TYPO to assist
with error correction.

I would like a 1050, and 800XL, and a 400, and a 410 (just to know it) and a few magazine.... How much does it cost...? But I need them to be functional... and here is the trouble....I'm in southamerica... ... and have no much money... (it's no joke) I really would like to have that Atari stuff. I'm an atari fan... but my old 65XE got burned (I tried to connect it with my PC.... no success) Well you have the last word...

A 520ST would be nice.... ( $ ?)

I love Commodore 64 and Amigas, its sprite feature fascinated me, but unfortunately I did not had any of them. I had Spectrums, MSX and MSX2, then Macintosh Classics and finally nasty PC's to work on...

Commodore... great

Thanks for the ref. I thought it was going to be something from the 80s but
it looks like it is only ~5 years old.

Most of the references to it were about the recall and lawsuits. Looks like
the company went south after the recall or at least changed hands.

I don't have an Atari set up right now but I think I remember quite a bit about Action!

I know it hard to formulate a question if you don't have some source code or manual. If you can still think of some questions you might want to ask under those limitations I can probably answer a few.

It is a little more like Pascal then C. Experience in either of those two languages transfers well.

I didn't care for the procedures being put ahead of the control loop. Really it didn't matter. Other then that it was a perfect format for my programming style. I always work from an outline, so it was easy to do right in the program editor. It was also pretty easy to flesh out the procedures called for in main() since the editor works great in insert mode.

Hi there

I guess the Atari games are independent from those systens NTSC or PAL which implies (to me) that games are not written to NTSC or PAL... Am I wrong? I used to think that NTSC or PAL is an external feature of the Atari system... again... Am I wrong? I'm not sure now... thanks for your answers..

Yup, that's about right. There WAS a similar thing in the 80s,
the Ideal Skeet Shoot, only it didn't take cartridges as far as I
know.

> Most of the references to it were about the recall and lawsuits.
> Looks like the company went south after the recall or at least
> changed hands.

Didn't know they were having all that much trouble... That might
explain why I can't find the carts I still need.

I've heard about a little app that let you plug the atari joy into the serial-9pin on PC.... JOYPC or something like that.... It was supposed to work with emulators but also with PC games... although I couldn't download it from the link... maybe somebody know about it....

## 2532. Atari 800 Power Supply

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-26 04:08:53 UTC
From: Scott <scottlit@cableone.net>
Message-ID: <vak1im5p7b5nc4@corp.supernews.com>
Source record: 21891

Does anybody know the power supply requirements for the original Atari 800? I have one (Atari 800, not the power supply) at my Dad's house, but can't find the power adapter for it, and I need to know what the voltage / current / polarity output of the power adapter is so I can provide a suitable replacement. Any help would be greatly appreciated.

Thanks,
Scott

best regards

VF
Mike Stepansky <design3d@2-scale.com> escribi&#65533; en el mensaje de noticias 3E2F1607.5488AEED@2-scale.com...
Hi Atarians,
I need an FTP or Web sites to answer the following questions:
Does anybody know the TITLES of the 8-bit games software (commercially released in USA and over the Europe)?
Also, about how many commercial game titles (both in cartridges and disk-based software) were released for the Atari 8-bit computers? I am not talking about ANALOG binaries or BASIC codes.
I heard about Nadral and BioDefense, a rare game. I have both of them. Nadral is a rare game from Germany with built-in voice synthesis for the XL. (not sure what Nadral stands for?) BioDefense talks to you after you scan and enter the point of virus dispersion in the human body (ie. like Fantastic Voyage theme)
Also, does anybody know about a disk-based interactive called "Verbal Abused" (?) which you type something and it will talk (not voice) back to you on screen until you beat your psychiatrist's mind. (like Eliza, an AI simulator for Mac).
An Atari Veterans,
Mike

I don't know of any BBS's that still have this, but wasn't it an Atari ST
BBS game? I seem to remember raiding other players for planets, then using
the planets to build fighters and cruisers. Since it typically updated at
midnight, one trick was to make a move just before midnight, then dial in
again just after midnight and move again, before the other players react.

Don't. The serial port carries +12V and it is likely that you grill the chips
in the PC if you shorten two wires at the serial port by connecting it
with the joystick. The pinout is really quite a lot different, and not
suitable to connect it to digital joysticks.

So long,
Thomas

Howdy *.*!

The Falcon/ST series are often associated with a bee, because of the
waiting mouse cursor of TOS/GEM.

I've thought about an icon which is typical for the 8-bit, but I think
there is no symbol short and concise just like the bee. Isn't it?

While its true the pinouts are very different and a one to one
connection won't achieve much, there is little danger of a short
damaging anything because the +/- 12v (which can legitimately range
from 5 to 15 volts or so) is current limited to a few 10s of
milliamps.

Unless I'm missing something, there isn't a simple interconnect that
will suffice for the interface. I imagine the various control lines
being driven to either polarity can be detected on the PC's uart, but
the interface circuit will probably involve a few parts.

>again... Am I wrong? I'm not sure now... thanks for your answers..

The problem can be that a PAL system has (IIRC), slightly longer VBI. So a
game that uses these extra cycles will work on a PAL machine but will cause
vertical rolling on a NTSC 8-bit. Also, the PAL system can display a few
more lines on the screen without causing rolling.

Hello All,

Just a reminder that I have auctions running with less than 24 hours to go on a copy of the book: 'Advanced Programming Techniques for your Atari Including Graphics & voice programs', by Linda M. Schreiber. Published in 1983 by Tab Books, Inc. 207 pages. ISBN: 0-8306-1545-8, and also a very rare copy of issue 1 (from 1984) of 'User Guide to Microcomputer Software - Software Index'. This was a general 80's UK magazine, which was actually a monthly software listings and review magazine, which covered all the popular micros of the day, including the Atari 8-bit. Well worth a look.

I also have some Atari disk-based software on there with starting bids of just GBP0.99 with no reserve!

The link is below (this will split on to two lines, so please copy both lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangarraghty

Another good thing about the FAQ...it lists *all* the power supplies
rom Atari that can be used with the Atari 800. Some supplies that
are used for other things and put out more amperage than the 800 needs...
can also be used with the 800.

You can find the FAQ at:

<http://www.faqs.org/faqs/atari-8-bit/faq/>

It was the other reason for it's existence but you could also add what
they called a Co-Processor 86 and add MsDos capablebity to it also. If I had
some CP/M disks I would certainly try them but alas I don't. After
re-reading the manual it seems you only need the disks that came with it to
access the CP/M functions. It seems the ability to add PC drives (for use as
Atari8 disk drives ) is built into it and there are jumper settings to
configure these. I want the disks because that what came with these units
(heck--I want that Co-Processor 86 thingy too !! ).
Anyone out there who is familiar with these units and can tell me if I got
this right is gonna get in my Atari8 gratitude Hall of Fame. Mike.

The ATR has a build in Z80 processor to run CP/M. But if you wanted MSDOS to run you would have to order (back then) a intel 8080 CPU that plugged in with the Z80. You could run most MSDOS stuff. But when it came to graphics like CGA forget it. It was a completely text mode version of msdos you would run. The cool then too what you can do with the ATR is hook up a dumb terminal to it and put your bootable CP/M disc in. there were some jumpers inside you would have to change for that to work and you had to have PC floppies installed and not use the 1050 disc drive as the boot.

Still better, telnet towel.blinkenlights.nl - pure ASCII, no Java trash
required.

hehehehe... I remember that one.

I had this one guy that decided to call himself 'Mosquito' because every time he attacked me, he would take a little bit from me each time. Then I made a Total Defense Pact with the most powerful player and he pulled the 'midnight' stunt (if I remember right, you got something like four or five moves a day) which to his utter surprise ended in complete failure on his part.

Another stunt was food. If you could afford it, you would buy ALL the food on the market, driving the price up. Then sell it at the higher price, going back and forth throughout all your turns doing this. Most people became VERY rich and powerful this way.

I didn't know this was an ST thing though, all I knew is that I was calling a BBS which I honestly thought was an Apple. It just sort of had that feel... can't explain it.

## 2563. Announcement: cc65 v2.9.1 released

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-27 10:24:23 UTC
From: uz@remove-to-reply.musoftware.de
Message-ID: <n4bg8b.5d7.ln@news.musoftware.de>
Source record: 21923
Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit,comp.sys.apple2

I'm proud to announce version 2.9.1 of CC65, a C crosscompiler /
crossassembler combo for 6502 systems.

CC65 has C and runtime library support for many of the old 6502 machines,
including

- The Commodore VIC20 (contributed by Steve Schmidtke
<steve_schmidtke@hotmail.com>).

- The Commodore C64 and C128.

- The Commodore C16, C116 and Plus/4.

- The CBM 510 (aka P500), a quite rare Commodore machine (programs
run in bank 0).

- The CBM 600/700 family (programs run in bank 1).

- Newer PET machines (not 2001)

- The Apple ][ (library support by Kevin Ruland <kevin@rodin.wustl.edu>)

- The Atari 8 bit machines (thanks to the Atari team: Christian Groessler
<cpg@aladdin.de>, Mark Keates <markk@dendrite.co.uk>, Freddy Offenga
<taf_offenga@yahoo.com> and David Lloyd, <dmlloyd@atari-central.com>).

- GEOS for the C64 and C128 (GEOSLib by Maciej Witkowiak <ytm@elysium.pl>)

- The Oric Atmos (this one is BETA!).

The libraries are fairly portable, so creating a version for other 6502s
shouldn't be too much work.

This release contains bug fixes (see http://www.cc65.org/bugs.php for a list
of bugs that are fixed in this release), plus the following small additions:

* As a contribution to the Contiki project, the _heapmemavail and
_heapmaxavail functions have been added from the head branch.

* The BETA library for the Oric Atmos has been added from the head branch,
so I can get some more feedback.

There is still no support for the following features:

* Floats and bit fields.

* stdio file routines on some systems.

* The 80 column mode on the C128 is not supported by the conio library (this will come with the next major release, thanks to the initial work of MagerValp <MagerValp@cling.gu.se>).

Available packages:

As usual I will provide the complete sources and several binary packages, including RPMs for RedHat Linux. Linux is the primary development platform, so the sources do compile out of the box on Linux machines.

Please note that there are separate RPMs for the compiler proper and the target specific libraries. To develop for one of the predefined target systems you need the compiler RPM package *and* one of the target machine packages.

Binaries for DOS and and Windows will follow or may already be available at the time you read this. OS/2 packages will again be available, but since there are almost no downloads for OS/2, so the host platform may get dropped in the near future (again). As with the RPM packages, you need the package for the development system (Windows, etc.) *and* one or more of the target machine packages.

Download:

For more information and a download link, please visit the cc65 web page at

http://www.cc65.org/

Mailing list:

There is a mailing list for discussing cc65 related issues (programming, suggestions, bugs, ...). See

http://www.cc65.org/#List

for information on how to subscribe to this list.

---

Thanks to all who sent feedback and suggestions, and of course to anyone who helped developing cc65!

Hi All:

I'm looking for the game code for Shoot. The code was published in Analog or Antic, I'm not sure. The original ver was, I believe for Rom rev A. All the usual searches on google etc with the authors name and game title haven't come up with it so far. I have the exe and can run it on my pc but I would love to see it again on my 800.

Thanks

The ATR8K is a complete hardware device containing a disk controller
interface; no special software is needed to use generic PC floppy drives on
the Atari.

IIRC the Hacker premise was you just connected via modem to a remote system
and you must discern commands and enter passwords, etc. to gain entry and
navigate around. Not sure if you need to crash it.

>
> Why is it that Galaga, one of the most successful arcade games of all time, never had many home versions? I don't believe there was ever an official C-64 version either. What official home versions were there? I know there was a 7800 version and maybe an NES version but that's all I am aware of.

I did some preliminary work on graphics for an Atari 8-bit Galaga
(using my 'Super IRG' flickery mode).

http://www.newbreedsoftware.com/atari-galaga/

Perhaps I'll need to play with CC65 and see if it's a good environment for
me to code in (I'm getting rusty with Action!), and see if I can whip something
out. :^)

In the meantime, I encourage any other coders out here to take on the task.
It'd definitely be an excellent game to clone on the Atari 8-bit!!!

Two come to mind right away. Mirax Force and Zybex.

Mirax Force was a lot more like Uridium for the C=64.
Zybex was a lot more like Life Force, in my opinion.
(It wasn't ships you flew, though... it was little dudes with jetpacks)

The timing in a lot of games and demos are a little too fast on NTSC
systems, too. (i.e., the music and motion is faster than it was designed
by the folks who were programming it on PAL Ataris)

Also, sometimes an NTSC Atari will crash when running a PAL program.
Again, this is typically due to the shorter VBI length...

Vincen Fast <grampta@yahoo.com> wrote:
> I've nevr seen that game. Is the A8 "Star Riders" the same as the 2600???
> Where can I find an ATR??

Star Raiders was originally for the Atari 800, so the 2600 version that
came a few years later was a 'port', so to speak.

The graphics on the 8-bit version are WAY better than the 2600.
(Not too surprising :^) )

I honestly haven't touched 2600 Star Raiders since I played it as a kid,
about 20 years ago (holy crap!), so I can't really give a good comparison.

Just that I'm guessing the Atari 800 version is probably better in almost
all respects. ;^)

I'm sure you can find a cartridge of it somewhere for cheap.
I've somehow ended up with about 3 copies, myself.

I remember... you have to select a robot... and get a map (world map) something like this... the initial screen seem to be a terminal emulator but it runs without any action (I guess) the robot screen is a kind of test, you have to identify the robot parts... Are we talking about the same game??? I think it was made by activision...

Source record: 21945

Uh, I've never seen one of these- but if it is as the name implies 'analog'
then it would stand to reason that it doesn't need a driver. I would think
an analog joystick would just be a pad of switches under the stick
mechanism.
Mo

> Mo

That's correct but... in order that Flight Simulator II (which is
expecting input from a digital stick) can support the MicroFlyte a
driver is installed first. I bought my stick on Ebay and there's no
driver.

The US company which built the stick, Microcube, advertised
extensively in Antic and Analog magazines (see
www.atarimagazines.com/v5n5/productreviews.html) and also built a
version for the ST (www.atarimagazines.com/v6n3/stproductnews.html).

# 2587. Re: Montezuma...

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-28 10:09:16 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3EACFDCC.D4920C4F@students.uni-mainz.de>
Source record: 21800

Well,
I merely have the tape version (and the un-official cart) of Montezuma.
I created a disk version of this tape with Howfen DOS. If you are
interested, send me an E-Mail and I will return the ATR image...
-Andreas.

P.S.: The official disk version(s) of Montezuma are extremely rare -
just ask Andre Sitz how long it took him to find the original disk
version. But the tape version (from Databyte) isn`t that rare...

Jindroush schrieb:

Well,
take a look at the Homepage of Homesoft. He has the big (32k-37k) and
the small (16k) file versions on his site. I merely have a backup of the
small 16k tape version on diskette (this is not a file, it is a special
Howfen-DOS bootdisk). I also have the un-official cart, but I don`t have
any tools to make a backup of this cart or to create a file version from
it... -Andreas.

# 2595. New eBay Atari auction - 1982 Epyx Games Catalog (MINT)

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-28 19:21:59 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1051557786.97682.0@iapetus.uk.clara.net>
Source record: 21808

Hello All,

I have just started a new eBay auction for:

A mint condition 1982 Epyx Software catalog. This 16 page catalog has half page descriptions of
each of their games of the time, along with photos of the boxes. A one page chart at the back shows which games
were available on which platforms (Atari 400/800, TRS-80, Apple II, VIC20, IBM). This catalog is in 'as new' mint
condition and is a MUST for serious collectors. - Starts at 0.99pounds with no reserve.

I also have some Atari disk-based software on there with starting bids of just 0.99pounds with no reserve!

The link is below (this will split on to two lines, so please copy both lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangarraghty

no. to simple :-) ... Here is my contribution:

"READY"

but it isn't a symbol. It's a text. Perhaps with a blue background and a
big fat non-blinking(*sigh) cursor, it also a symbol :)

# 2604. M.U.L.E. cartridge preorders being accepted!

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-29 08:39:15 UTC
From: Mark DiLuciano <markdil@ix.netcom.com>
Message-ID: <SSqra.621$RR4.422@news.randori.com>
Source record: 21817

Well, after a lot of work, they are finally finished! We will be accepting preorders for the M.U.L.E. Cartridge on Monday [4/28], 10:00 AM Pacific time. Keep in mind, we only made 50 Cartridges. That is it! There will be NO more! Each cartridge is individually numbered.

You can preorder by going to http://www.sunmark.com anytime after 10:00 AM Pacific time. The first order gets cart number #1, second order gets cart #2....etc. If you want a particular number, please specify in the comment section of the order form. If you order more than one, we will send you consecutive numbers.

The carts will be shipped the week of May 12th. Until then, the price will be $34.95 each. After May 12th, they will be $39.95 each.

Well, is it ? World Karate Championship, isn't that the one originally
called International Karate by Archer McLean ?

2600 extra controller was neat though :-/ I really loved that game, on both
formats, but the A8 version using the controller, that would be nice!

I believe CDs and DVDs are written by lasers and should not be affected by
normal intensity light or X-ray radio waves. Exposure to magnetic fields
might exert a force on any metal embedded in the plastic discs, BUT not
sufficient strength to permanently alter the tiny reeflecting bits.

# 2616. Custom DL problem

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-30 00:42:53 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <vau6vc6ov445cb@corp.supernews.com>
Source record: 21829

I'm writing a program in BASIC that has a custom display
list. The custom display list is for a GR 7 screen with a
text area at the bottom I'm using. I have two ten line
sections of the GR7 area that I point to with LMS
instructions at line 62 and 72. I point to pictures at
certain points in the program, then back to the regular GR7
screen memory (the 10 line sections are in a string).
So, my display list has a 77 (64+13) at line 62, then I can
point to my pictures by putting the adr($) after the LMS.
My problem is that the screen loses one line of the GR0 area
at the bottom of the screen. If I delete one line of the
GR7, one less 13 in the dl, then the GR0 area gets all four
lines, but then the bottom line of my GR7 screen is gone.
That's my problem.
Thanks for reading.

There is a very old (but free) MS GIF animator, if you can find it. It's
kinda crappy, but it does the job if you've got the GIFs and a few trial
and error runs.

Problem is without a distinct match of the Atari font, it looks very much like
a C64.

How about the symbol on the XL/XE series inverse-video key? It looks cool and
is distinctly Atari.

> I think it's the multi-colour sprite issues which maybe causing the
> reluctance.

I'm not sure I know what you mean...

In my design, the only real sprites on the screen would probably be the player's ship and the bullets. The bugs would all be SuperIRG characters.

Most of the time, the ship is at the bottom, so it could use at least one extra player or missile (its bullets only appear above it, so use a DLI to reposition them horizontally for use as part of the ship's graphic).

Or, you could do the ship in SuperIRG (or plain vanilla IRG) mode, and have it scroll smoothly using horizontal fine scrolling. ;^)

> It's already quite a busy character screen..

I think, even with the chunkier movement (a coarseness of 4 pixels horiz. and 8 pixels vert.) and artifacting when bugs collide, it'll still be a fun game.

I'm definitely not suggesting using multicolored sprites for all of the bugs. That'd be darned near impossible. Even single-colored ones would end up with a lot of flickering (see: Joust).

I think Galaxian used IRG characters for marching bugs, and then kicked into P/M graphics for diving bugs. (That's more difficult in Galaga, since the bugs don't just dive, but they also loopde-loop and swirl and stuff ;^) )

Hi,

> I'm writing a program in BASIC that has a custom display
> list. The custom display list is for a GR 7 screen with a
> text area at the bottom I'm using.

Basically, the type of text window you get with a plain
and simple "Gr. 7"?

> I have two ten line
> sections of the GR7 area that I point to with LMS
> instructions at line 62 and 72.

2x10 = 20 modelines antic D, then? This makes 40 scanlines.

> I point to pictures at
> certain points in the program, then back to the regular GR7
> screen memory (the 10 line sections are in a string).

This is in particular a bad idea for two reasons. Number one
is that BASIC might try to relocate that string depending on
its mood, hence you'd loose the absolute addresses. Point two
is a common antic problem, namely that its program counter is
not able to cross a 1K boundary by itself. This means in
particular that *if* it happens by bad luck that the string is
placed right below a 1K boundary by BASIC, Antic will continue
to execute something entirely different than intended.

> So, my display list has a 77 (64+13) at line 62, then I can
> point to my pictures by putting the adr($) after the LMS.
> My problem is that the screen loses one line of the GR0 area
> at the bottom of the screen. If I delete one line of the
> GR7, one less 13 in the dl, then the GR0 area gets all four
> lines, but then the bottom line of my GR7 screen is gone.
> That's my problem.

I'd recommend the following:

i) Put the display list into a fixed address and ensure that
you never cross a 1K boundary as far as the list is concerned.
ii) Put the graphics in a fixed position (or use the one supplied
by the Os) and ensure that you don't cross a 4K boundary with the
graphics/or use an LMS instruction.

If that doesn't work, I'd suggest just to post the complete
DL (in disassembled form) here so I'd could have a look at. Sorry,
but your description currently still causes a mess in my head, and

I'd need to really see it before I can say more... (-;

Greetings,
Thomas

Hi,

> I don't believe C=64 Koala pads are compatible with Atari 8-bits,
> and vice-versa.

I wouldn't be so pessimistic about that. The pinout of the C64 and Atari joystick ports are identically, and the Koala pad I knew used the potentiometer inputs for the position signal. What can happen, of course, is that the orientation of the input is wrong (left/right swapped, or x/y axis swapped).

Clearly, if this is the case, you'd need to hack up the Atari Artist software a bit; question is whether you feel able to do this. (-;

So long,
Thomas

but there is also a Koala Painter avaible for the 8-bit, which looks
nearly the same to Atari Artist. Would'nt make sense for me, when they
made a different version on the same 6502 programm design.

> made a different version on the same 6502 programm design.

Well, AFAIK they did this unfortunately. The EOA "Music Construction Set"
is able to use touch tablets as input devices, but offers two different
settings for it: Atari Artist and Koala Pad, meaning that they were
different. IIRC, something trivial as an axis swap.

Greetings,
Thomas

and do you think, that there is a hardware difference between the "c64
koala pad" and the "atari koala pad" ?

Hard to say as I've never owned a C64, leave alone its Koala Pad. Thus,
I'm up to guessing. However, it would be astonished if there would be a
difference (would have been higher production costs without any benefits).

Greetings,
Thomas

# 2637. Re: Custom DL problem

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-30 17:18:07 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <vb019ars4t98d1@corp.supernews.com>
Source record: 21750

```
(BASIC moves $s and 1k and 4k boundaries can
cause bad problems with a DL.) My memory isn't
so good to remember exactly what you said.
Posting the DL is possible, but here's the code that
sets the DL up. It is a 10 line $ that I insert into the
screen by changing the first LMS to point to one of
the two 10 line strings I use, the a second LMS to
point back to regular screen memory.
j=peek(559)
poke 559,0
poke dl+67,77 (put a lms at mode line 62)
x=scrn+40*62 (scrn and dl are 88,89 and 560,561)
hi=int(x/256):lo=x-(hi*256)
poke dl+68,lo:poke dl+69,hi
for n=1 to 9:poke dl+69+n,13:next n
poke dl+79,77 (now point back to scrn memory)
x=scrn+40*72
hi=int(x/256):lo=x-(hi*256)
poke dl+80,lo:poke dl+81,hi
for n=1 to 7:poke dl+81+n,13:next n
(if I only put n=1 to 6, I get the four lines of GR0)
x=scrn+96*40:hi=int(x/256):lo=x-(256*hi)
poke dl+89,66:poke dl+90,lo:poke dl+91,hi
for n=1 to 3:poke dl+91+n,2:next n
hi=int(dl/256):lo=dl-(256*hi)
poke dl+95,65:poke dl+96,lo:poke dl+97,hi
poke 559,j
return
lemme see that would give a dl, from the top of my head
112*3,77,scrnlo,scrnhi,then 13s down to offset 67 where
thers a 77, then $lo,$hi,9 13s,a second lms 77 at offset
79,scrn+40*72 lo, same hi,7 more 13s,a lms gr0 66,
lo scrn+96*40, same hi, 3 2s, 65, dl lo, dl hi.

My game is working, and I've compiled it. You wanna
take a look?
Russg

# 2638. New Vintage Computer Community

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-30 17:27:55 UTC
From: Erik Klein <ekklein@pacbell.net>
Message-ID: <vlTra.489$726.83945598@newssvr14.news.prodigy.com>
Source record: 21751

Hello,

I would like to announce a new message board that I have created in support of the vintage computer community.

During the past couple of years I've been participating as a lurker on this and other newsgroup as well as on several mailing lists. I have made a few observations that I felt needed addressing including:

- the need for a better way to advertise items or help (wanted or offered)

- the ability to support off topic conversations along with on-topic ones without burdening those not interested in one or the other

- the ability to easily search archives for topics of interest

- the ability to keep "threads" of discussion together

- the ability to categorize these threads for easier research

With the above in mind I decided to experiment with a web based bulletin/message board (a long way from my days with RBBS and WWIV). Over the past month or so I have changed my web hosting service for www.vintage-computer.com in order to work with a hosting company that could support the new forum I was considering. Over this past weekend I finished the initial phases of moving my site and configuring the boards. The result is now available for use at www.vintage-computer.com/vcforum. A link is also available from my www.vintage-computer.com front page.

There are two things that I would like to stress about the new forums. First, I don't envision them as a threat to this news group or the community that supports it. I see it as another tool in our toolbox (or toy in our toy chest) to enhance our enjoyment of our hobby.

Second, although I set up these forums I consider them to be "ours" in as broad a sense as that is possible. I am not only willing, but anxious to have others participate in these forums as administrators, moderators and contributors. Volunteers are welcome and operators are standing by!

Hopefully if you are reading this you will see your way clear to popping over for a visit and supporting this effort with whatever you are willing to offer, be that participation, suggestions or criticism. Again, this is our community and I will do my best to make these forums reflect that.

Thank you and best regards,

Erik S. Klein

## 2639. Atari VCS joystick repair?

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-30 19:43:53 UTC
From: Witchy <news@sruasonidyranib.co.uk>
Message-ID: <dk90bvo0bbb8gmepipqk001nmulcovheb5@4ax.com>
Source record: 21752

Hi folks,

Has anyone ever repaired the plastic insert in the standard CX40
joystick? I've got 2 here that are toast for the usual reasons
(snapped), and so far efforts with Superglue and bonding plastic glue
have failed.

cheers all

witchy/binarydinosaurs

# 2640. Re: KoalaPad Touch Tablet for 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 2003-04-30 23:53:47 UTC
From: Anders Carlsson <anders.carlsson@mds.mdh.se>
Message-ID: <k2g3cjz8ruc.fsf@legolas.mdh.se>
Source record: 21753

Thomas Havemeister <twh1@gmx.de> writes:

> and do you think, that there is a hardware difference between
> the "c64 koala pad" and the "atari koala pad" ?

It's quite easy to find out what a C64 uses the game port pins for
and compare to what is possible on the Atari. Would this Koala Pad
plug into the first or second game port to begin with?

```
Pin# C64-1 C64-2
_____________ 1 JOY A0 JOY B0
\ 1 2 3 4 5 / 2 JOY A1 JOY B1
\_6_7_8_9_/ 3 JOY A2 JOY B2
4 JOY A3 JOY B3
5 POT AY POT BY
6 BUT A/LIGHT PEN BUT B
7 +5V (max 50 mA) +5V (max 50 mA)
8 GND GND
9 POT AX POT BX
```

Then there are issues like interconnection between game ports and the
CIA controlling the keyboard etc, but I doubt something like a touch
pad does rely on bus conflicts to operate properly.

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.
---------- Forwarded message ----------
This FREE Atari list has been and will continue to be updated. I've added and given away items already.This is aimed mainly at Atarians in Portland, Oregon USA. Gone are Hard Drives including both Atari MegaFiles as well as the Indus GT and both Atari 1050 Drives.The Atari 810 Drives still remain.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

==Text Below has been updated last on 04/11/2003 5:00 A.M. PST==

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer!

Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives,
as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==

I'm sorry, if I was to bother with Shipping, and even worse, "Customs"! I would have to be selling. Too much work, not enough money. Defeating the purpose of "FREE"!

==Sorry==
==Thanx==

Proving my point all along that you have the mental capacity to know what
is right and wrong and how to address your customers - or perhaps possible
customers. Also you have the ability to do other work to supplement your
atari business so that people don't have to feel sorry for you and make an
exception. That's all. Plus there's good medication for bipolar
disorder. I know people who are on it.

Thanks,
Mark

That was actually my first guess too, untill I realized it's the same "ready" as on C64, Sharp, Acorn, etc :-))

> but it isn't a symbol. It's a text. Perhaps with a blue background and a
> big fat non-blinking(*sigh) cursor, it also a symbol :)

What about a picture of the XE 'start' button? (or 'select' or 'option'). I know the key is the same as on ST/Falcon, but that's
why there should be 'start' written on it in stead of 'F1' - F10'...

Have I made a pass at Turing's Testicles yet? Turing was very unhappy and very gay at the same time: an enigma to all of us. His motivation and drive came from his balls, his brain was filled with fury at the world and at himself. He did not think logically if he could avoid it. He hid from himself in his technological well-ordered play-world, where no-one despised him because no-one existed there.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Please do not cross post your messages to me on comp.sys.cbm. Keep it on comp.ai.philosophy. Thank You.
So watch the newsgroup: field thats displays the newsgroups that it is sent to.

I am going to ask that no more discussion on this thread on comp.ai.philosophy and that means this and every newsgroup this was crossposted to unless it explicitly states comp.sys.cbm.

Matthew Montchalin, please stop cross posting messages. Start new threads in those newsgroups. I do not mean multi-cast posting which is an absolute NG ethics violation.

# 2660. Re: Custom DL problem

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-02 08:15:51 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <b8t9fn$qvc$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 21773

Hi Russ,

> (BASIC moves $s and 1k and 4k boundaries can
> cause bad problems with a DL.) My memory isn't
> so good to remember exactly what you said.

Well, what I'm saying is that you need to be careful
with 4K and 1K boundaries when setting up a DList.
However, it seems that you take an Os generated list
and modify it as required. How do you create this DList?
By means of a "GRAPHICS 7+16" I suppose?

> Posting the DL is possible, but here's the code that
> sets the DL up. It is a 10 line $ that I insert into the
> screen by changing the first LMS to point to one of
> the two 10 line strings I use, the a second LMS to
> point back to regular screen memory.
> j=peek(559)
> poke 559,0
> poke dl+67,77 (put a lms at mode line 62)

ANTIC D, LMS. Ok.

> x=scrn+40*62 (scrn and dl are 88,89 and 560,561)
> hi=int(x/256):lo=x-(hi*256)
> poke dl+68,lo:poke dl+69,hi

Ok, you'd therefore overwrite the DL'instructions
at offsets 68,69 for the target address. GR.7 has
96 rows and only a single LMS at the beginning,
so you should be relatively save here.

> for n=1 to 9:poke dl+69+n,13:next n

Wouldn't be needed as I guess since that's setup to
ANTIC D anyhow by the Os.

> poke dl+79,77 (now point back to scrn memory)
> x=scrn+40*72
> hi=int(x/256):lo=x-(hi*256)
> poke dl+80,lo:poke dl+81,hi

Ok.

> for n=1 to 7:poke dl+81+n,13:next n

See below.

> (if I only put n=1 to 6, I get the four lines of GR0)

Ok. I suppose that you opened the screen with "GRAPHICS 7" to
get a text window. Then, the screen layout would be as follows:

3 x 0x70 24 blank lines total
0x4d LO HI LMS start
79 x 0x0d 79 lines ANTIC D
0x42 LO HI LMS start text window
3 x 0x02 ANTIC 2 text window
0x41 LO HI jump back to the ANTIC start

The 0x42 LMS text window start is therefore at offset 3+3+79 = 85, hence
in the middle of the addresses you're poking to. The reason why you get one
text line less is because you overwrite it with the above loop.

The problem you're facing here is than an LMS takes two additional bytes
in the display list, though there isn't room for additional bytes there
without overwriting already setup display lines.

```
> x=scrn+96*40:hi=int(x/256):lo=x-(256*hi)
> poke dl+89,66:poke dl+90,lo:poke dl+91,hi
> for n=1 to 3:poke dl+91+n,2:next n
> hi=int(dl/256):lo=dl-(256*hi)
> poke dl+95,65:poke dl+96,lo:poke dl+97,hi
> poke 559,j
> return
```

```
> lemme see that would give a dl, from the top of my head
> 112*3,77,scrnlo,scrnhi,then 13s down to offset 67 where
> thers a 77, then $lo,$hi,9 13s,a second lms 77 at offset
> 79,scrn+40*72 lo, same hi,7 more 13s,a lms gr0 66,
> lo scrn+96*40, same hi, 3 2s, 65, dl lo, dl hi.
```

```
> My game is working, and I've compiled it. You wanna
> take a look?
```

I guess I'd already know what's going on here. (-;

I think you're best off with setting up a new DL completely since
yours requires more memory anyhow.

So long,
Thomas

## 2662. Re: how to protect disks from being ERASED in the MAIL

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-02 12:52:06 UTC
From: dunxuk@aol.com
Message-ID: <20030502085206.08180.00000505@mb-m03.aol.com>
Source record: 21775

Best way of stopping disks being erased in the mail is to erase them first and then re-write them at the other end...

;^)

## 2663. Double Pokey Stereo games and demos?

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-02 13:09:42 UTC
From: Dub <dubaloo@yahoo.com>
Message-ID: <j7usa.1585$E87.79487@newsfep2-gui.server.ntli.net>
Source record: 21776

Does anyone know any links for games or demos for the Atari8 that use stereo sound and only 64K?, preferably in .atr so I can send them through my ape interface, Ive just done my first double pokey upgrade and nothing to test it with!

Regards
dub

## 2664. Programmers Info: How to read ATARI DD Disks on a PC

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-02 13:17:52 UTC
From: Carsten Strotmann <cas_news@strotmann.de>
Message-ID: <b8tr60$dfs45$1@ID-174234.news.dfncis.de>
Source record: 21777

I have put Sourcecode, References and some MS-DOS PGMs online on "How to read ATARI DD Disks on a PC". It's about reprogramming the PC Floppy Drive Controller. Maybe this is useful for someone (How about a Linux Kernel/FS Driver to mount ATARI DOS 2.5 DD Disks?)

http://www.strotmann.de/twiki/bin/view/APG/AtariPCDisk

Source record: 21779

Yes,
they are one and the same. in europe it was called International Karate
(and also Karate, whereas in America it was called World Karate
championships. The US version was distributed by Epyx and featured a
nice title picture. But the game itself is Int. karate... -Andreas.

Nope,
the hardware is (afaik) the same. only the software differs... Once upon
a long ago, AMC-verlag sold some port-switchers, they turned an ST-mouse
into an Amiga mouse (or vice-versa), a koala-pad into a touch-tablet (or
vice versa), etc. etc. There were 8 different port-switchers available.
Alas, no more... -Andreas.

# 2671. Re: Custom DL problem

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-02 20:00:20 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <vb5jhc78g96e55@corp.supernews.com>
Source record: 21784

Tom Says:
"The 0x42 LMS text window start is therefore at offset 3+3+79 = 85, hence
in the middle of the addresses you're poking to. The reason why you get one
text line less is because you overwrite it with the above loop.

The problem you're facing here is than an LMS takes two additional bytes
in the display list, though there isn't room for additional bytes there
without overwriting already setup display lines.
"
I appreciate the help. Don't quite understand.
Right, my two extra LMS require 4 more bytes
in the DL. I am using a GR. 7 to create the screen,
so it has a text area, with a stock DL starting
at $8FA2, extending to $9000. Screen memory
starts at $9060 for the GR7 and $9F60 for the
GR 0. There is room for my DL which is 4 bytes
longer than the OS generated one. The stock DL
is 94 bytes long, mine is 98 bytes long.
The stock DL goes 94 bytes $8FA2 to $9000.
Mine goes $8FA2 to $9004. The area from $9004
to $9060 isn't used. There's also an unused area
from the GR7 screen bottom ($9060+d80*d40)=
$9CE0, to the begining of the GR0 area at $9060
+d96*d40=$9F60. From $9CE1 to $9F5F isn't used.
From $9005 to $905F isn't used.

There's room for my 4 bytes longer DL between
the end of my DL ($9004) and the start of screen
memory ($9060).

My DL has the same number of GR7 lines (d80) and
the same number of GR0 lines (4). The OS won't
display the 4th GR0 line however, or Antic won't.
XLIT does display the 4 GR0 lines, as I expected.
Only when I ran it on a real Atari and then also with
atari800win do I miss the 4th GR0 line.

Odd. I specifically remember having problems trying to use my brother's
C=64 Koala pad with the example program I found. But an Atari 8-bit one
worked.

This WAS years ago, though, so I could be totally confused or dumb. *shrug*

> starts at $9060 for the GR7 and $9F60 for the
> GR 0. There is room for my DL which is 4 bytes
> longer than the OS generated one.

Yes, as far as raw memory is concerned, yes. However,
*if* you want to display the same number of Graphics 7
modelines - do I assume this correctly? - you'd need
to write more bytes in front of the Gr.0 modeline
instructions. Hence, what happens here as I suppose is
that the Gr.7 modelines (Antic D) overwrite the modelines
of the text window, and this is really because you need
to fill in more bytes for the same number of modelines
than before.

> The stock DL
> is 94 bytes long, mine is 98 bytes long.
> The stock DL goes 94 bytes $8FA2 to $9000.
> Mine goes $8FA2 to $9004. The area from $9004
> to $9060 isn't used.

Right so. However, the area from $8ff7 = $9000 - 9
is used for displaying the text window, and you'd
partially overwriting this area with the LMS/Mode D
instructions. What you would need to do is to re-write
the text window instructions as well. *However*, there's
another caveat here. $9000 is a 1K boundary, and ANTIC
won't be able to cross it. You'd either need to insert
a jump instruction ($01 Lo Hi) and accept a single blank
line, or you'd need to start the DList four bytes earlier.

> There's room for my 4 bytes longer DL between
> the end of my DL ($9004) and the start of screen
> memory ($9060).

Yes, but that's not the problem. The point is that
a) as far as I remember, your program doesn't rewrite
the text window instructions (correct me if I'm wrong!)
and
b) doesn't take into account that the Antic program

counter doesn't wrap from 0x8fff to 0x9000 by itself.

> My DL has the same number of GR7 lines (d80) and
> the same number of GR0 lines (4). The OS won't
> display the 4th GR0 line however, or Antic won't.
> XLIT does display the 4 GR0 lines, as I expected.

Antic won't. XLIT is, as I suspect, broken and doesn't emulate the
limited antic program counter correctly (FYI, Atari++ does, of
course... (((-;)

> Only when I ran it on a real Atari and then also with
> atari800win do I miss the 4th GR0 line.

Yes, see above.

Greetings,
Thomas

Hello All,

I have just started a new eBay auction for a nearly-new Atari XL/XE PAL TV cable. The auction for a mint condition 1982 Epyx Software catalog is still running with only a couple of days left (still at 0.99pounds). I also have some items of software on there too.

The link is below (this will split on to two lines, so please copy both lines into your browser):

Message-ID: <3EB4661F.6C757A70@rogers.com>
Source record: 21794

Hi everyone,
Back round '85 or so when my C64 was still working I had an activision (I think) game called "Slotcar constroctuion set", not to be confused with racing destruction set (not by activision). Since I still have a working 130XE and 800 I was wondering if this game ever made it to the atari 8bits? Another game I would like to locate is River Raid. Anyone know of any dealers I can get originals of these from?

thanks
James

# 2682. Re: Custom DL problem

Date: 2003-05-04 03:35:37 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <vb92nri3e51rcc@corp.supernews.com>
Source record: 21795

Thomas said, in a previous message, which really
didn't register for me:
"i) Put the display list into a fixed address and ensure that
you never cross a 1K boundary as far as the list is concerned.
ii) Put the graphics in a fixed position (or use the one supplied
by the Os) and ensure that you don't cross a 4K boundary with the
graphics/or use an LMS instruction.
"
I think I understand now.
And in the present message described my problem,
crossing $9000 with my DL.
Thank you.
(Yes I do have the same lms (66) lo, hi, 2, 2, 2 for the
GR0 area as the stock DL. Followed by the 65 ($41)
dl lo dl hi.)

Apple 8bit and Commodore 1541 use GCR. Atari 8bit and IBM use MFM. Which is better and realible? Why?

Hello.

AFAIK, Atari 8-bit disk drives used the GCR format as well. As for the
merits on GCR vs MFM, I really don't know.

Enjoy.

> better and realible? Why?

Both systems have 2 purposes:

1.) Limit the number of consecutive 0 bits since those can't be synced on. They're stored as "nothing happens" basically while 1 bits are stored as "something happens." You can determine the exact moment something does happen but you cannot determine the exact moment when nothing does happen. And so the circuit wouldn't be able to compensate for small variations in rotation speed which always occur in mechanical drives if you had many 0 bits following directly after each other.

2.) and provide a way to discern between data and metadata. E.g. the "this is the start of this track" mark musn't be confusable with some piece of normal data. So if you need to store a bit of data that just happens to be identical to the mark, it has to be changed in some unambigous way.

GCR is easier to implement in Software. It takes bit patterns and replaces them with other (longer) bit patterns that don't contain many consecutive 0s. On reading it converts them back.

Apple stored 3 bits for 2 in the beginning (13 sector disks) and later 4 bits for 3 (16 sector disks). Commodore stored 5 bits for 4.

MFM is easier to implement in Hardware. Basically it inserts extra "halfway" bits into areas with consecutive 0s. Since they're halfway in between the normal bit positions they can be discerned and thrown out on reading back the data.

Apple used the computer's main processor to decode, Commodore put a general-purpose CPU into the drive, IBM and most CP/M computers put a custom chip into the drive. Atati I don't know.

Both method are pretty reliable if not pushed to the max, which no system really does since users are know to value data security over disk size. (What's the point of storing an extra 80KB on the disk if I can't retrieve the data?)

I've successfully read disks almost 20 years old of both the GCR and MFM variety.

fup2 c.s.apple2 to reduce crossposting.

I use 2 very good filters and a virus checker already, it's just a
piss in the wind if you ask me.

But, sadly it's just making the group more pointless and unreadable.

I've read this group for many many years, actively helped many and
think of myself as a regular and good group person yet this person who
knows me and I know him feels the need to ruin the fun by making the
group stagnate just to prove that him and his mates have some little
hint of power.

What power?

The power to post via Dizum...Whoopie....very manly.

The power to mailbomb..very old school

Nope, it's just the power to ruin a group with childish stuff making
readers clear off in droves.

Nice one S.....You might just win and fuck the whole group up, you
must be proud.

<sigh>

# 2694. Atari 800 emulator on Mac OS 9 without a joystick

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-04 17:37:55 UTC
From: Mark Watson <newsAfoftDfsnetD@co.uk>
Message-ID: <Sdcta.12746$up3.2283@post-02.news.easynews.com>
Source record: 21607

Hi,

I have just been playing with the Mac OS 9 port of Atari 800 done by Derek Ledbetter. Looks very good, but I have a problem I was wondering if anyone can help with...

Seems this version does not support keyboard emulation of a joystick. The laptop I'm running it on does not have a joystick, so I can't play any of the games. I can see two solutions to this:

i) Get a program for the Mac that allows the keyboard to function as a joystick input device.
-> Can't find such a program -> anyone know of one?

ii) Modify the source to support keyboard input.
-> Sure it wouldn't be hard to add. However I know little about Mac programming (I'm a Windows and Unix programmer...). I also don't have a copy of Codewarrior 7. Please please can someone do this?

Any other suggestions? Would be great to play all the old games on this Mac laptop (upgraded Powerbook 1400).

Hope someone can help.

Thanks,

Mark

Todd,

No! Atari 8bit disk drive always uses FM/MFM. PC uses MFM that can read
Atari 180K disks but PC cannot read GCR disks which Commodore 1541 or Apple
II formats. Commodore 1581 uses MFM that can be read by PC.

An even better approach is to let them filter out themselves. Usually
those who can't standup for there thoughts tries to hide there acts by
using the header line "X-No-Archive: yes" to avoid being archived by
search engines.

Simply add this line to your kill filter and they will not bother you
again!

A typical Newswatch kill filter might look like this:

Newsgroups: *swnet.diverse*
Newsgroups: *alt.nuke.thomas-nord*
From: *sinclap*
X-No-Archive: yes

Howdy folks

It happened again last week. I copied a file from my Atari via BBXFER 1.9 to a PC and after the file was stored on disk (when I check, the filename is in the directory, IIRC with the correct length) the first FAT on the PC disk got mangled. This same scenario has happend to my before so it must be a bug in BBXFER. Who can help? (I'm not an assembler programmer) Can somebody fix BBXFER so this will no longer happen? Can somebody please tell me how to retrieve the files off that disk. I have the HMTL code for my internet site on that disk.

CU Mathy van Nisselroy

Sure.

Assembly on a 6502 is a lot like BASIC with only 3 variables but 64,000
memory locations. On an Atari a lot of the routines to do useful stuff are
just calls to the OS which make it easy to do things like change graphic
modes or input files from a disk drive. You just make the jump from PEEK to
LDA $<some memory location>, POKE to STA, GOTO to JMP, and GOSUB to JSR, and
you do fine.

http://home.earthlink.net/~atari8bit/a8links.html
Is a good place to start a search for specific information.

# 2706. Account Problem

Hello,
For the last week or two, a LOT of my messages had not been posting for some reason. I even tried one message three times all together and it never posted, yet other messages often posted.

I tried posting at different times, sometimes at 3am, sometimes at noon, etc.

Now, I cannot seem to log on to the server at all. Says something about how I need to log in, is something wrong with my password?

The User Name is RandyJabsco.

Also, there is a change to my email address. Where it used to be RandyJabsco@yahoo.com it is now j70141@hotmail.com

Thanks for your assistance

More 6502
```

Another good program for looking at 6502 source code is here:
This site is in French and English Home page.
http://pvb.free.fr/Atari/Atari_Index.htm

http://pvb.free.fr/Atari/Download/
Several very good programs for viewing 6502 opcodes within Atari disk or file. All Atari fans ought to be getting this stuff.

Good luck

Wish I could; I assume BBXFER is a 6502 executable which manipulates the
floppy board disk controller to write MSDos format data to a PC type disk..

Sounds like you need someone with the expertise that Carsten posted about
recently.

Heres a few of my favourites that I still play on my 130xe and 800 regularly,
not in any perticular order though!

Beach head
Beach head 2
Raid over moscow
Roklan invaders
Pole position
Pac man
Star raiders
Joust
Strike Eagle
Ultima 3
Ultima 4
Battlezone

and a bunch of others I cant remember at the moment.

Hi Ron,

I thought River raid would have made it, the slot car construction set is the one I'm not really sure about. I'm still looking for that one. I'd rather play it on my atari 8bit instead of grabbing aonther C64 system again.

## 2715. trying to identify a game from memory

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-06 04:23:03 UTC
From: lemonjimm@yahoo.com
Message-ID: <de0bdca5.0305052023.190c0c71@posting.google.com>
Source record: 21628

This goes back to 1983 or so. My friends had an Atari 800.

I loved the text games. Abuse was lots of fun, especially after we edited it with the names of people we knew and other nonsense. They also had Zork I and II and another game they had labeled as "Soft" and later known as Leisure Suit Larry (left a word out so as not to alarm the parents!).

Looking back, we all cannot remember one or two particular text games. Actually, they weren't strictly text because you could hit the spacebar or something and a 'still' graphic would appear/disappear.

Here are the vague details and realize that I may be confusing the two games because I think they were from the same vendor.

- a line about "wolfing down the potion"
- brown letters on a light brown background
- cactus
- areas of the gamespace were 'borders' - ie you'd reach the mountains or the ocean and not be able to go that direction any more
- I think the screen re-drew itself after every 'RETURN'
- things would be removed from the still graphic after you picked them up
- I am fairly certain that it balked at more than two words per line, actually I think that it was fairly unforgiving and didn't react to any 'funny' words like Zork did.

Thanks, hopefully some of this will sound familiar to someone out there!

# 2719. ANNOUNCE: Atari 8bit filesystem driver for Linux 0.1 released

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-06 09:44:37 UTC
From: Michael Beck <beck@ipd.info.uni-karlsruhe.de>
Message-ID: <b98068$r6m$1@news.rz.uni-karlsruhe.de>
Source record: 21632

Hi,

On the website

http://www.rho-sigma.de/atari8bit/fs.html

you can find the first public release of the Atari 8bit filesystem
driver for Linux.

About:

ATR8FS is a ATARI 8bit filesystem for Linux released under the GPL. It
originated from the 8bit ATARI machines. It allows to read disk images from
a more than twenty years old computer :-)

Features of Version 0.1

- Can mount ATR images (currently the only possibiliy to access
a ATARI 8bit disk :-)
- Can read DOS2 compatible filesystems, like DOS 2.0S, DOS 2.0D,
DOS 2.5, BiboDOS, MyDOS ...
- Can read DOS3 filesystems
- Can read DOS4 (Antic DOS) filesystems
- Can read SpartaDOS 2+ compatible filesystems
- Currently NO write support
- Currently no direct disk access
- Alpha implementation, not heavily tested yet

Have fun,

PS: Sorry if this may be posted a second time, I crossposted it to c.o.l.a
which was not allowed ...

(replies to self)
I always like to hear how stories end, or continue.
There is about 500 bytes between the end of GR7
lines and the beginning of GR0 lines in a standard
GR7 screen.
I put my DL there (modifying the OS DL with
4 more bytes caused the DL to cross a 1k boundary).
I have two 400 byte strings that display a picture
in the GR7 area. Now one of them got a corrupted
display, because the string address crossed a 4k
boundary. So I moved that data to the same area
I put the DL. That leaves one more 400 byte string
that still is displaying properly, even tho it is bad
form to use a string address to point a LMS in the
DL to.

> I'll be checking those some thanks.

NES, if I have it right, used a derivitive of the TI graphic chip made by Yamaha. Foggy memory but I think it was the TI9930. The TI9930 was used in a couple of systems TI/99 and Coleco Vision IIRC. There was also a hack written up in Byte Magazine Circuit Cellar where it was put in an Apple II board.

It was and is an interesting chip. Has its own graphic memory and will refresh ~16k of DRAM. It has sprites and all the features you'd expect in a 2nd generation video chip.

Very cool. Would be even better if it worked with atarisio.

Sorry to hear that you got burned. Bugs with the BBXFER can probably be laid at my feet, since I wrote the original for Bob. I know he's had to fix a few other problems with it since I gave it to him.

An old style sector editor like Norton DD ought to be able to get your files back.

From: williaj@sympatico.ca
Message-ID: <7773a4d3.0305061240.7589bc06@posting.google.com>
Source record: 21644

Pretty nifty that you found that page on micro-spl Tom. I downloaded the paper from the acm, but it didn't have too much more info on it.

My guess is that M-SPL was written in itself, and that Action! is the Mac/65 translation of that code. The comments in the source led me to believe that perhaps Parker was translating from Action! itself, but after seeing that page, it seems obvious that he was translating from Micro-SPL into Mac/65, almost verbatim. It's too bad the source for the original M-SPL compiler isn't available.

You're probably right about the editor. While it is not Action! generated code in the cartridge itself, the source shows that much of it is a translation from something. I bet they wrote an editor for that system and CP just translated it for the Atari. I wondered why it was so goofy in parts.

Thanks, Jeff. I've put together everything I have on Micro-SPL and BCPL
and posted it at- http://cth.dtdns.net/SPL/ . In the BCPL ZIP archive is a
demo directory which contains a bunch of source code that looks amazingly
like the Action! demo source code (primes, etc.). In the dragon curve demo
is source to output postscript that is just waiting to be ported to
Action!.

## 2735. ATARI is back!

Infogrames, the current owner of the ATARI properties is planning on re-using the ATARI brand name. Log into Yahoo! *Financial* and search on the ticker symbol IFGM, and you will find the news story of the name change as well as other recent IFGM news stories. Incidently, the new ticker symbol will be ATAR, and their new game "Enter the Matrix" looks to be a blockbuster.

Hello Michael,

great work!

I've thought about this Idea when I collected my information on how to
access ATARI DD Disks on a PC last week. Its at
http://strotmann.de/twiki/bin/view/APG/AtariPCDisk

Maybe someone find some time to include this knowledge in the driver, so we
are able to mount ATARI DD Disks. I'm currently bound to the ATARI USB
Project...

Sands Of Egypt! Took a Google search with those words and found this
- http://nitros9.stg.net/sandsofegypt.html. Screenshots look awfully
familiar. This led to this -
http://www.lysator.liu.se/adventure/Datasoft,_Inc.html.

Still not 100% sure I am remembering one of two games but a glance at
Datasoft's other things shows nothing familiar.

Thanks!

That's really cool work! Thanks a lot!

BTW: I read in the docs that reading (real) disks doesn't work yet.
Reading/writing/formatting disks in Atari format is quite simple in
Linux: just insert the disk and use

setfdprm /dev/fd1 SS DD sect=18 ssize=256 gap=0x0a fmt_gap=0x14

to configure the floppy driver. Then you can read/write the disk
using eg dd if=/dev/fd1 bs=256 of=... and format it with fdformat.

The only slight problems are that the data is stored in inverted
form on the atari disk (so you have to do a XOR 0xff) and that
fdformat uses a sector interleave of one (which results in slow
loading on the atari). I solved the first issue with a small program
that turned a raw dump into an ATR image some time ago, and never
cared about the second issue :-)

If you need some help with your driver feel free to contact me!

so long,

Hias

I have never had any problem with sending one or many dozens of software disks through the mail. Xrays don't affect them. I do note "Floppy disks-Do not expose to magnetic fields", and insure them.

CDs are affected by heat, not normal Xrays or magnetic fields.

EPROMS use ultrviolet, EEPROMS use 12+ volts(though a wider variation now exists), and should normally be O.K. considering the vast numbers of electronics passing through the systems.

Postal Worker story..that was almost assuredly the fault of the sender. Regulations require the send and receive on the same side, in specific places. Other wise, use large print for the TO address(and write TO big) and the from address a lot smaller(with From printed next to it), preferably on the side connected to the top of the package. Make sure the TO side has room for the postage.

There is a wire-in schematic to tap RGB and H & V syncs, and audio.
The ST monitor still rolls a bit. I may need to change the transistor for the
Vsync line. I just haven't had time to look at it in a long while.

Right, almost any standard disk size, printer, or modem. The 64K version defaults to a 48K printer buffer. You only need a driver to use the serial port for a modem. It could be used for a printer.

You need an ATRMON boot disk(ATARI) or ATRMON in rom. Then you boot to CPM using a CPM disk. If you can, then you boot to msdos using a DOS disk. If it crashed, you started over!

MGA is probably more accurate, TTL luminance video output. VGA is a stretch as it has color, but may not be all that different signal wise from mono. Bob W. is the one I am familiar with, there may be others, don't know.

> isn't
> > > a good idea.

Without updating the rom, you will have some problems using the 3.5 inch. The capacity and step rates differ. Commercial progams won't like it much.

Just replacing the drive will not make the disk readable on the PC without software.

A lot better sticking with 5.25" or use a floppy emulator.

Rick D.

That's facinating stuff. I really enjoyed ACTION! and it would be cool
if someone could find Mr. Parker and do an interview.
Thanks for posting that stuff on the web.

I am pretty sure I have an atr image of it somewhere, as well as the
original disk. It's the only one I remember that had pretty much all
of your criteria. I remember our whole family (4 of us) sitting around
the 800 trying to figure the game out. We finally finished it too. Ahh
the memories.

Hi Tim,

If you, or anyone else is in the Toronto, Ontario area check out the Ative Surplus store on Queen street. they've still got a few 8bit items including 1200xl keyboards. I think they still have a few programs and sio cables too last time I was there.

> Isn't the controller a separate switch board? <

Yes, in this case the Controller (capital "C") was a small PCB with 2 toggle switches and an amber LED. The top toggle switch controlled Fast/Slow mode and the bottom was a write protect "controller". IIRC, some of the features could be reset or overridden with the Happy Software. A very useful addition to the Happy. Innovative Concepts out of Dearborn, MI also sold an "Imitation Controller" which did most/all the same things.
Larry

## 2756. Question about selling BlackBox

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-08 06:03:30 UTC
From: Bob Ryan <ryanr@one.net>
Message-ID: <3EB9F332.7010508@one.net>
Source record: 21719

I have a 130XE with a BlackBox and hard drives. Everything works. The BlackBox has the 1.34 ROM in it.

Unfortunately, I've come to realize I must sell it. My question is: do I sell the BlackBox and drives separate from the 130XE? Or do I sell it as a package?

There's a bunch of stuff on the drives, I haven't gone through the directories to see exactly what on them though. The person I bought it from said he used to run a BBS with it.

Is anyone interested? If so, make me an offer. I could possibly connect it up and take some pics if necessary.

-Bob

I doubt it, to be honest the Infrogrames thing is more a publicity
stunt to tie in with their release of Enter the Matrix. There have
been other Atari branded releases already with no announcement so I
presume its just hype.

It's for real. I bought some shares of the newly release ATAR stock (Atari!), and it already went up $1.60/share that day!

Granted, its just hype to publisize their games - with the legendary Atari name, but if it works, great.

Wonder if my 100,000 shares of the original (Tramiel) stock is now worth something again! <grin>

You'll probably sell it quicker seperately, but it will have more
value is bundled.

> Is anyone interested? If so, make me an offer. I could possibly connect

I may be interested in the entire collection - for inclusion into my
Max-A-Flex system. Give some thought to $ and get back to me.

What would be the point? It would be a totally different set of engineers
etc and would effectievly be something like an X-Box or Playstation 2 with
the words rubbed out and 'Atari' written over the top.

# 2770. FREE Atari stuff! Spring Cleaning!

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-08 20:27:51 UTC
From: Bravo Sierra Computers <atari@aracnet.com>
Message-ID: <Pine.LNX.4.44.0305081318550.26157-100000@shell1.aracnet.com>
Source record: 21733
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,pdx.forsale

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==
===Ben===

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received

Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Hi,
Put a price on the whole package! And yes some pictures would be nice.
Is the 130xe PAL or NSTC??

Regards.....

If they've done the research and are convinced that the Atari name will sell some games for them, that's as far as I think they'll go. Forget hardware of any type.

Just my 2¢.

Since so many have interest and the price is undecided, why don't you have a silent auction here on the group? Just have everyone submit their bid to you directly (not the group) and let the high bid at a predetermined time win it.
Just a thought,
Mo

From: Russ Gilbert <russg@en.com>
Message-ID: <vbm9bljmal5049@corp.supernews.com>
Source record: 21744

Atari hardware has some patents that might still
be usable, probably not much.
The main thing that the Infogrames Atari wants is
the reputation as a pioneer gaming symbol.
The Fuji is a nice logo, they're using that. I doubt
'Power without the price.' will be used, but stuff
like 'Frogger', 'Centipede', and probably 'Space
Invaders' have/will be re-issued (I know 'Frogger'
was re-done.)
So the name recognition and reputation, and the
names and concepts of classic Atari only games,
like pac-man have the value.
Some games Atari didn't own, but were pretty much
Atari only, like maybe 'Mule' or 'Alternate Reality',
might also get re-done.

O.k., if you force me.

I'd like to get at least $240 (US) for the BlackBox and drives. Sold as
a set. I won't separate them.

I haven't powered it up in a while, but I won't sell it if it doesn't work.

O.k., how's this:

Blackbox and drives $240.00
NSTC (US) 130XE, Blackbox and drives, cables $275

plus shipping either way.

I'll have to check to see what the drives are as far as size and
make/model. And I'll take a look at what software is on the drives.

Source record: 21498

Bob,

You could still have the silent auction, as long as the NG knows that this
will be your minimum reserve price. If no one bids over this price you
could sell to the highest or keep it for EBAY auction or not sell at all.
This sounds like a good deal to me.. Price is possibly too high at 275.00
for all to bid on. But you could still get several bids, and then decide.
Mothers Day is this weekend so I will be out of town until the 12th of May..
Regards and good luck
RoyE.

8-bit ATR's are fairly easy to find. I played to game and yes that is
it.

There was another game - now it is coming back to me, it was not made
by the same vendor - much cheesier graphics and you needed to get to
the moon before the earth blew up. That one we finished.

Frogger wasn't an Atari title, although it was certainly released for Atari hardware. My 8-bit Frogger cartridge carries both the Sega and Parker Brother names; I'm not sure what the story is there. Space Invaders was created by Taito, IIRC, and Atari merely licensed it for release on game consoles and computers in the US. I don't know the story behind Centipede, offhand. OTOH, I don't know what's happened to the copyrights on any of these titles since their release. It's conceivable that Atari has snapped them up or (in the case of Space Invaders and others like it) still owns limited rights to them.

Nonetheless, your basic point still has value; I suspect that Infogrames changing its name to "Atari" is being done to boost its visibility and reputation for marketing and PR purposes.

Got the certificate on e*Bay for around $300.00 a few months ago.
Just bought it as a momento and for my Atari collection. It was
originally issued to Sam, but its unsigned, unused, etc..

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

It works for me. They should do an 8bit version of Enter the Matrix. ;)

# 2799. Pokey upgrade did not work

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-10 12:02:22 UTC
From: Thomas Havemeister <twh1@gmx.de>
Message-ID: <b9ipnd$jglej$1@ID-112582.news.dfncis.de>
Source record: 21512

Howdy !

This weekend I installed the Stereo Deluxe upgrade by Freddy Offenga
into my XE. Of course, I had to desolder the hardwired Pokey with a
solder sucking tool. The same to another Pokey which I found in an old XE.

After the installation and wiring with CPU pin13 and LM358 pin6 I
tried to boot up my xe and as a result, the normal funtionality was
NOT given. The error description: The normal blue screen appears with
a white cursor on the upper left. At this point the disk drive should
start booting, but isn't.

I also have installed a QMEG OS expansion, and so I could open it's
menu with RESET+SELECT. In this screen I noticed, that also the
keyboard characters aren't working. This tells me, that the normal
funcion of Pokey (with our without stereo enabled by the switch) is
not working in its normal way.

:-( .. this is hard. It was a very well upgraded system (with 1MB
Simm, QMEG) and now the Stereo will not work :-( ...

Do you have perhaps an idea? How and in which order I could check the
device?

# 2800. High Density Disk works with XF551

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-10 17:02:40 UTC
From: Hon Tseng <pcuser45@yahoo.com>
Message-ID: <Qgava.72620$3h5.3536774@news2.east.cox.net>
Source record: 21513

XF551 tried to format high density disks. It works. I know XF551 cannot use 80 tracks per side. BIOS in XF551 has limited sectors such as max 18 sectors and 26 sectors per track.. Can I customize more than 18 or 26 sectors? How? Like IBM, I can customize 360K disk to 400K or 720K to 800K by using 800.com in DOS.

Hon

From: Dean Garraghty <dgs@clara.net>
Message-ID: <1052665318.87196.0@dyke.uk.clara.net>
Source record: 21518

Hello All,

I have just started a new eBay auction for the prototype DGS Digi-Studio Musical Keyboard (Atari XL/XE). This is the only one ever made and comes with the original prototype software to drive it. This is a very rare bit of kit, and I know many people have asked to buy it in the past. It's well worth a look.

I also have some items of software for auction.

The link is below (this will split on to two lines, so please copy both lines into your browser):

You can replace the ROM in the XF551 with one that can use 80 tracks.
If you do a Google search for "XF35" you can probably find the code somewhere
on the web.

# 2809. Re: High Density Disk works NOT with XF551

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-12 10:33:56 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3EBF7894.191DD30A@students.uni-mainz.de>
Source record: 21522

Well,
the XF-floppy controller (the same as in most ST floppies) merely allows
80 tracks, DSDD or 720kbytes. Thus, High Density (1440kbytes) is not
possible with the XF floppy (no matter if you use a 5,25" or 3,5"
drive). But you can easily patch the XF-Os to allow 80 tracks and 3,5"
drives/disks. Then you can use Sparta or MyDOS and read/write/format
720kbytes. If you install a HD 3,5" drive, simply use a write-protect
notch on the HD-hole of HD-diskettes. Now the drive will think it is
only a DD-disk and will format it correctly with 720kbytes...
-Andreas.

P.S.: There is a description by Bob Wooley on how to upgrade your XF551
with a 3,5" drive (and how to update the XF-OS). To enable high Density
you would need another controller (~16Mhz, like the Ajax controller),
which is a difficult and expensive task, since the XF uses 8.33 and not
8Mhz (for HD it might need 16.66Mhz)...

Hi,

> If you install a HD 3,5" drive, simply use a write-protect
> notch on the HD-hole of HD-diskettes. Now the drive will think it is
> only a DD-disk and will format it correctly with 720kbytes...

Just let me add a comment on that: If you use HD disks, ensure that you
really have a newer HD drive for it. Older DD drives cannot write reliable(!)
on HD disks. The reason is that the HD disks require a higher magnetic field
strenght to get permantently magnetized that cannot be delivered by a DD
drive. The result are disks that "may look fine", but typically only stay
intact for about a week or so before they loose their magnetization, and
hence their contents.

Greetings,
Thomas

In theory this is true. However, my XF 551 has a 720 Kb drive in it, ripped from an Atari 520STFM and I only use HD disks (most
are TDK) without any problems for years now. I think the 5.25" disks suffer more from the DD vs HD issue then the 3.5" do.

Any of the older ones should work.
Ones that require Windows to work, obviously
won't do any good.
Older printers, and some new ones, have built in
fonts. Windows printers require the fonts from
windows.
For example, a HP 682 or 692 have their own
fonts. Probably new cheap printers, the $49 ones,
probably are Windows only printers.

I got my keyboard working ok by removing the Mylar sheet and reapplying it.
Seems to work ok for the moment. I guess the 1200XL keyboards are bad for
not working? I have a 800XL and 130XE and they all work perfectly...

I live in Markham Ontario and am moving house shortly. I have an Atari 400 and an Atari 1200 with 3 disc drives of various lineage, an interface module, a printer, a modem, about 30 game cartridges, several joysticks, programming books and what have you.

I am willing to give them to someone who can provide a good home. You have to pick them up though soon.

I also have a Commodore monitor but I want to sell it.

Please contact me by email if you're interested.

Dale Gloer

PS. I apologize if this group doesn't allow advertising - I picked it from the dozens of Atari lists and don't have time to read them all to find the "right" one.

OT but kind of a laugh. A lot of those $49 printers have both parallel and USB interfaces which means they have some brains on board.

Somebody dumped a new Epson Photo Stylus 810 on the ground by my mailbox. I think new they sell new for ~$99. I tried it out naturally and it was missing the cartridges and wouldn't even attempt to print until I bought some. I figure the person that dumped it probably got a replacement that used the same cartridges so they pocketted them.

$50 later, it would have only been $35 but when you buy one of the wrong cartridges for $15 that is what happens, I am back to testing it out again.

Paper feed was major SNAFU, used up mucho ink and otherwise blank paper trying to get it to feed, so I tear into it. Darn things are snapped together with only 3 screws in the whole box to keep it from unsnapping. Found a loose microscopic spring and guessimated its proper position. Printer works like a charm now.

Anywho, I will stick it on a regular printer port and see whut happens. Seems like we should run down a modern ~$50 printer that will work with an Atari. The prices on them are so low that we don't have to come up with a lot that work.

## 2822. any atari 1200XL production numbers?

# 2823. Re: inkjet printers

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-14 01:34:41 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <vc377mg0tmpn86@corp.supernews.com>
Source record: 21536

I got a $325 HP 682C one year.
It got funky, one of the little foam wheels came undone
and jammed it. I took it apart and removed the
wheel (it was down in the paper path and couldn't
see it without taking the printer apart.) It worked
ok after that (the adjustment lever had to be half
way or it would 'ratchet' across the paper. It finally
got bad with the 'ratcheting' and I got a used 692C
for $7 at MicroCenter.
Inkjet makers would give away the printers, because
the carts is where they make their money. It costs
$60 to put two new carts in, they last me about a
year as I don't print much. It comes to about 10 cents
a page just for the ink. I don't fool with trying to
re-fill the carts, the carts aren't designed to be re-filled
reliably in my opinion.
(Rick says the Epson carts, 2 I presume, are only $35.)
Sorta like the X-box and PS-2, the X-box sells for
$199 and is less than cost, M$ wants market share
and software sales. I don't do much game consol,
but the software is where they make money, and
all current console makers pretty much force 'exclusive'
on game developers.
(Uh, oh, I'm rambling again.)
On topic. My first disk drive, a Rana 1000, today
and yesterday I bought 3 on-off switches before I
got the size right. The on-off switch on it is just held
in place by the two pins to the circuit board and the
original switch one pin just broke. My new switch
has screws holding it. I also had to replace the dip
switches on the drive, I replaced with just a right angle
header and use jumper tabs to make settings.
(Just a little more.)
My 'Skunk' game is coming along, works pretty good
now, I made a ML routine to use in BASIC to print
any string to a GRAPHICS 7 screen. Use ABC
to compile it with. Got the custom DL and display
ok now. Oh, Ron Hamilton, uhm. The address
of a BASIC usr call does go to $D4 $D5 when
you are using BASIC. But if you compile it with
ABC, $D4 and $D5 are used by ABC, ie. my
program I had to just pass the adr(ml$) and do my
400 byte jump on page 6.

Source record: 21537

Unless you want color, a LaserJet would be a better choice. I use a 4P on my Atari - you can set the font from the front panel or from the printer driver - the cartridge lasts *forever* and never "dries out" - the "ink" does not run - it has a straight through paper path - it is reasonably fast - it is designed to print thousands of copies..... and, it takes very little space.
You can also find lots of bigger old LaserJets that will work. All of them use PCL commands so they are compatible with each other. An old 4Si will even print duplex (both sides of the paper) right from your Atari. This is great for those long disassembly tasks.

Most of the PCL command list can be downloaded from HP if you sign up as a
developer. So if you want to do graphics or anything fancy...

Mark

I connected up the 130XE and Blackbox tonight. Everything works fine. No pics yet. Lot's of ARC files on the drives. Actually, there's two drives in the case, but I think I'm only reading one.

I would like to sell the whole setup complete

$250.00

Alternatively, send me an offer and if no one meets my asking price, I'll consider it.

Thanks,

-Bob
PS - I will be offering more of my stuff soon. Here's a partial list:

Happy 1050
Rambo 256k 800XL
Indus disk drives
Newell 800XL w/ omnimon, omniview, etc.. (may want to keep this one)
800 w/The Pill
Basic XE cart
Basic XL cart
Mac/65 cart
Action cart
3 in 1 cart w/Action, Mac65 and Basic XL
and more....

# 2827. Re: any atari 1200XL production numbers?

I understand it was a US only interim model that had a production run of less than a year. It was intended to be a business end machine to the 800, but the XL range with the 800XL seems to have suplanted it quite quickly so apart from the 1400/1450XL (which i belive were only in a limited run anyway) it had the shortest production run of any Atari . Like most companies i dont think Atari ever produced offical production figures.

Over here in the UK, they are as common as rocking horse poo

Bob Wooley preferes them, they are pretty robust,
and they have more room in the case for the stuff
Wooley puts in them (I know I can't spell Wooley right.)
They may command a slightly higher price than
the 800xl, probably less than the 130XE. I'd
guess a good working example of the following on
e-bay:
600xl-stock $15
800xl-stock $30
1200xl-stock $35
130xe-stock $40
800-stock $35
Add the following
256k upgrade $20
Omnimon $15
Bob Puff or Steve Tucker OS $25
A Bob Wooley 1200xl with a PBI, 200 meg ide hard
drive internal, 1 meg memory, Bob Puff OS, Wooley
video upgrade, Black Box, 2 hard drives (or maybe
a MIO), R-Time 8 cartridge, SpartaDOS X 4.22
package, maybe $500?:)
These are US NTSC prices, your mileage may vary.

Sorry, Russ;
Thought we were in Basic, did not realize you'ld compile it...
Have you verified that the adr(ml$) function is accurate in a compiled
situation? Probably OK; set to a fixed address since the interpreter is not
there to reallocate memory and shift string space memory.
Good to know what you learned for reference.

For 8 bitters, not much I would imagine. Although (this also has nothing to do with 8 bit), THE most exciting gaming news I've heard in a long long time is that it looks real positive that Atari and Firaxis (Sid Meier) are teaming up to do Pirates 2, one of my all time favorite games (played it on the ST and Amiga).

# 2841. Re: 1200XL PAL

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-15 03:15:36 UTC
From: Bob Woolley <ataribobdelete@directvinternet.com>
Message-ID: <3ec306c9$0$9656@fountain.mindlink.net>
Source record: 21655

The 1200XLs do not seem to have the extra circuits for PAL that you see on
the other systems.

Sorry...

now, about $500.00 for a 1200XL???

http://cerebro.cs.xu.edu/~ryanr/atari/blackbox/pic6.jpg
http://cerebro.cs.xu.edu/~ryanr/atari/blackbox/pic7.jpg

The controller is a "Konan" (pic 7). I didn't disassemble it far enough to get the make and size of the drives. The drive housing is from Xerox (pic 3), and has its own power suppoly (pic 6). The BB ROM is 1.34 (pic 1, pic 2). The drives are running MyDOS 4.50 (pic 4), and have lot's of stuff on them (pic 5)

# 2846. FREE Atari stuff! Spring Cleaning!

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-15 08:07:05 UTC
From: Bravo Sierra Computers <atari@aracnet.com>
Message-ID: <Pine.LNX.4.44.0305150104020.15273-100000@shell1.aracnet.com>
Source record: 21659
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,pdx.forsale

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==

Hi, Ron.
It was a good suggestion (use $D4/$D5 for a
JMP instead of a BEQ/BNE for code longer than
128 bytes branch). It worked fine in BASIC.
I just added the offset to where I wanted in
my program (#$73 or so). I originally didn't
pass the adr(ml$), just used $D4. I could tell
from the program exectution that it was missing
the jmp ($D4), it would print one letter and hang
with the compiled code, my loop was for printing
the next character. So I just passed adr(ml$) in
the usr call, stored in about $610, added my offset,
and did the indirect $6C jmp to $610.
It was one of my more challenging ml projects and
I'm pleased it works, prints to G7 screen like it
was a OS routine.
So, no, I couldn't verify that the compiled code was
using $D4, I just assume the compiler needs that
for something.
Russ

Considering rocking horses are made of wood and don't go "poo", it
wasn't that difficult to figure out. ;-)

By the way, I'm in the process of sending a 1200XL with a working
keyboard no less to the U.K..

So now maybe there will be two.

Definitely yes.

I live in Israel, and we only had PAL systems here. When I bought my 800XL
about 20 years ago, the 1200XL was also available. However, I do not know
anyone who owns it (or any other Ataris nowadays, for that matter).

Hello fellow vintage computer fans,

A few weeks ago I announced the creation of the Vintage Computer Forum (http://www.vintage-computer.com/vcforum) and since then the response has been excellent! In just a few weeks we've had thousands of visits and hundreds of messages posted by dozens of new members with many more people coming by to have a look around.

I promise that I won't be posting my invitation repeatedly (I don't want to spam the group), but I would once again like to encourage anyone interested in vintage computing topics to swing by the VC Forum to see what it's all about and, hopefully, to sign up and participate in our discussions.

Topical areas have been created for a wide variety of interests including Apple, Atari, Commodore, DEC, CP/M, S-100, Vintage Programming and many more; including some off-topic areas for those so inclined. Additional topics will be added as they are requested by the VC Forum community.

Best regards,

Erik Klein

(1200xl goes for ~$100 ebay.)
I din't know that. Production numbers. All I can
do is tell you my two 1200xl are like 25206 203
and 26843 209, something like that.

Incessant newsgroup advertisements that don't change in content and really
irritate a lot of people. If you'd like to support that, then sure buy
from Ben. Otherwise I know of other Atari dealers who might be more
deserving of the business.

Message-ID: <3ec53b5e$0$26893@fountain.mindlink.net>
Source record: 21677

I think he is looking for how many 1200XLs were produced... I have only seen two "models" of 1200XL other than some real early machines, as opposed to many versions of both the 800XL and 130XE. When the 1200XL came out and people ran out to buy them, they found out that many, many programs would not run on them. The machine was not only very expensive, but large numbers came back as "defective" because of the OS changes. All of them seem to have replacement RF modulators also... I think these factors precipitated the introduction of the 800XLs and killed the 1200XL market. Anyway, many, many (I would guess 100,000 or more)1200XLs were produced, they just never got to market for long.

# 2865. eBay Atari Auction Reminder - RARE Digi-Studio Music Keyboard

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-16 21:48:50 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1053121812.83555.0@doris.uk.clara.net>
Source record: 21678

Hello All,

Just a reminder that the auction for the prototype DGS Digi-Studio Musical Keyboard (Atari XL/XE) hasn't got long left to run. This is the only one ever made and comes with the original prototype software to drive it. This is a very rare bit of kit, and I know many people have asked to buy it in the past. It's well worth a look.

I also have some items of software for auction, again with not long to run. Includes Alien Blast game for light gun, Quick programming language package, and lots more.

The link is below (this will split on to two lines, so please copy both lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangar raghty

## 2868. ATR 8000 Diagnosis

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-17 03:58:16 UTC
From: lfooch@bellsouth.net
Message-ID: <3ec5b2ee.12828736@newsgroups.bellsouth.net>
Source record: 21680

I'm trying to figure out if the ATR8000 I have will work at all. The power light comes on. When I attach a non-Atari floppy 5 1/4 drive using a std floppy cable, I get no response from the drive when I turn on the ATR. I would expect that the drive would spin up. Right ?

Tks

Honestly I've tended to be more of a lurker on newsgroups, but I have posted from time to time.

I just like the feel of the message boards better, myself. I think they are more user-friendly and tend to keep things somewhat better organized, for me at least.

There is definitely room for news groups, message boards, mail lists and more. I think a lot of our hobby is about information exchange in general and the more ways we have to do that the better.

Best regards,

Erik

Was it a double-density drive? Maybe the pin shunts have to be adjusted to make it drive 0. Also might check for a setting on the drive for head select or motor select. This may require a little trial and error. Do a google search on the drive number to find the shunt settings.

Thanks for the reply Mo. The ATR doc does mention how to set the
drive jumpers which I set accordingly (DS0). I also tried a drive
from a working Percom with the drive connected per instructions. Same
result.

Make sure the units are all connected and then powered in the correct
sequence. It is similar to the 800; power the drive first and then the
ATR8K - the drives should spin briefly as the ATR is powered or reset. There
is also mention in the docs about "mass termination" (some form of resistor)
on the drive cable; I do not know how critical that is..?

yes Rick. Is that a bad thing ? Got this cable from an old IBM XT -
got a twist in a center portion of the flat cable, other wise it's a
cable with two card edge connectors and then one other IDE-like
connector at the end.

Thats it I'd bet, try using a straight through cable with no twist. The fact that the manual mentions a DS0 setting tells you that it does drive selection at the drive not in the cable (twist). Also, if you are using only one drive make sure that it has a resistor pack installed near the cable connector on the circuit board. I actually don't have one of these yet, but I have worked with mini disk drives.

ron,

When I pulled mine out a while back and fired it up, it didn't work properly.
I can't remember if the symptoms were exactly the same as yours, but
I believe they were similar. After a little testing, I decided that it was likely
the controller chip--a 1795 I believe. I swapped it out, and that fixed it. I
don't know where you are located, but I was able to find a replacement at
HSC Electronic Supply in Santa Clara, CA. There web site is
www.halted.com. It appears that BG Micro (www.bgmicro.com) also has
the part. I don't know if this is your problem, but the part is not too pricey.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Thanks Richard.

On my board its and FD1797B-02. I also notice it's an eprom. IF
anyone has this, is it possible to get the working rom burned ? I
could then burn an new eprom. Just a thought. Now I'm looking for
the actual part also .....

## 2889. Atari Technical Reference Manuals?

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-18 13:49:10 UTC
From: "C. BOND" <cbond@ix.netcom.com>
Message-ID: <3EC78F56.B1C1A80D@ix.netcom.com>
Source record: 21552

The links I came up with were either dead or didn't have technical
reference manuals for the Atari 400/800. Does any one know of current
links which are active? I'm trying to debug an Antic emulator.

Thanks.

```
Hi,

There are:

C/65 for OSS
CC65 for Atari XL/XE (no cross-compiler version)
Deep Blue C
ACE C
Lightspeed C

And then I am sure there are even more around.

Yesssss! I also arrived my home place now at 23:00 o'clock. Well, the
streets are fucking full on sunday, but because of this perfect
atari-party, this is was no problem for me!

So my special grtx's are going 2 the following atarians:

* RIK/f2
* Mad Butscher/f2
* Grisu
* FloppyDoc
* H. Reminder
* T. Grasel
* TXG/MNX
* TWW/MNX
* MK
* A.Magenheimer
* C.Strohtmann
* Charon/Escape
* myself :-)

Yeah - keep cool - stay Atari!

special grtx to the belgium beer company, which makes it possible to
suck in raw masses of beer without having any troubles on the next day *gg

Thanks for your reply.. Do you know if any of these are FULL C compilers,
not Tiny C? I really need floating point, and structure passing would be
nice too..

I guess C++ would be asking too much, right? Were there ever any object
oriented languages for the 8-bit Atari?

Ron,

I'm sure mine must have been a 1797. I just remembered incorrectly. Maybe the 1795 was in my 1050, or I had a spare 1795 laying around. I know that what I had was not what I needed, so I had to buy one. As for it looking like an eprom, it is not. It is a controller chip, originally
made by Western Digital. They were pretty common back in the 8-bit days. The 1797 and its siblings were used in most, if not all, Atari 8-bit drives. I think B&G's price was about $5 when
I just checked it. I believe I payed $7 or $8 at HSC.

# 2898. ATTENTION COLLECTORS: ** Original Atari 2600 + 24 Games + Original Owners Manual + More ** Up For Auction

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-19 05:30:27 UTC
From: atheistdiary@aol.com
Message-ID: <406cee3a.0305182130.5d39c922@posting.google.com>
Source record: 21561

For those of you who are interested in an auction offering the
following:

- Atari 2600 with wood finish front
- 24 Games (some very hard to find)
- Original Atari 2600 Owners Manual (printed in 1980)
- Original Game Instruction Manuals
- a vintage Video Game Center containment box with wood panel finish
& tinted cover top
- plus more stuff listed on auction site

You can check out the auction I just put up at the following link:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3025299336

I graciously thank you for your time and I hope to see you there :)

A.D.

Because the ATARI has FP Routines in ROM, adding FP support to any language
is easy.
I would add ACTION! which is not plain C but similar, with FP and structure
(passing by refernce, not by value).

>
> I guess C++ would be asking too much, right? Were there ever any object
> oriented languages for the 8-bit Atari?
Well, everything (and more) is possible with FORTH. OPP extension in FORTH
takes 12 Lines of additional sourcecode :)

See
http://www.complang.tuwien.ac.at/anton/lvas/12-zeilen-oof

But, it's really a different kind of thinking, but worth learning :)

> cable with two card edge connectors and then one other IDE-like
> connector at the end.

No harm done but yeap. The IBM uses a twisted cable so they can just jumper both drives 0 and 1 as drive 1. The ATR8000 uses a straight cable and you have to jumper the drives 0-3 to use 4 drives. About 3' of cable is needed to do this too! I didn't get a single stack enclosure for my drives so I had to mount them 2X2 in a old scuzzy box.

After reading the thread there are a few other things you should try. First thing I would do is make double sure your drive is jumpered as D0. All IBM drives are jumpered as D1 and some even hard wired/soldered now so they can't be anything else.

One of the annoyances of an ATR8000 is every time you power it up, you are supposed to hit the little red reset button on the back. Apparently the Z80 comes up so faster then the drive or something. The busy light should flash on the drive when you do this.

I don't think an ATR will recognize a 1.44 meg floppy. If you are using one, insert a 720k floppy in the drive and it may work.

There should be an ATR manual online somewhere, I would do a google search if I were you. The manual includes a howto on making printer, modem, and floppy cables.

Yes, I did Ron but tks for the thought.

My next step is to replace the 1797 chip and see if that helps. Now
if can just find one... There are other similar chips available to me
e.g. 1795 in my Indus GT and a 2797. Per the emails from Richard, I'm
opening up a 1050 or two to see what's inside.

Anyone know if it's safe to try a 1795 or a 2797 in place of the
original 1797 ?

I think it can in CP/M but not as an Atari drive. I had the same situation with my 8" drives. I could get about 1.3-1.4 Meg in CP/M but only 720K in Atari. The interface specs of an HD drive in HD mode are very similar to those of an 8" drive.

Does the Atari port/original version of cc65 use floating point?
The Commodore port doesn't yet.

# 2908. Midwest Classic Returns To Milwaukee!!

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-19 19:40:04 UTC
From: wgungfu@alpha2.csd.uwm.edu
Message-ID: <babbuk$77g$1@uwm.edu>
Source record: 21571

Pac-Man, Atari, Pinball and More Coming to Milwaukee!

May 19th, 2003
The Midwest Classic Gearing Up For 2nd Year Of Fun and Entertainment!

Milwaukee, Wisconsin, April 17th, 2003 - The Midwest Classic, the Midwest's premier entertainment event, is gearing up for it's 2nd year in Milwaukee. Scheduled for June 7th, 2003, the Midwest Classic gives people a chance to experience the best video games, computers and pinball have to offer!

Dan Loosen, one of the co-organizers of the event said that "The Midwest Classic was such a success last year that we had to move to a larger location this year. So it will now be held at Nicolet High School located at 6701 North Jean Nicolet Road, Glendale, Wisconsin 53217."

"What kind of video games are going to be there?" is the most common question co-organizer Gary Heil gets asked. "Well, the Midwest Classic will give attendees the unique opportunity to experience everything from the old Pong and Atari video games system through to modern systems like the Sega Dreamcast and Sony Playstation." People will not only have the opportunity to play and enjoy many of these systems, but also to buy them as well. "There will be plenty of people there selling video game systems, accessories and most importantly the games. These include brand new games recently put out for many of the older systems as well," said Gary. The Midwest Classic will also be running video game competitions throughout the day, with over two thousand dollars in prizes being given away.

There will be featured displays and goods for older computer systems as well. "Remember the old Apple II's, Atari computers, Commodore and more you used in your youth? We'll they're still around, and just as fun as always!" said co-organizer Marty Goldberg. With the support of local computer user groups, the Midwest Classic will also have unique interactive displays such as the multi-player networked Midi-Maze game, last seen demonstrated at Milwaukee's Gen-Con role-playing gaming convention in the late 80's!

Classic coin-op video games will also be on display set on free play, as well as specially designed M.A.M.E. cabinets. Don't want to leave the fun when you leave the Classic? Don't worry, one lucky person will have the chance to win one of these coin-ops and take it home with them!

Pinball is also on the minds of many fans, a unique and older gaming experience that is on the rise again thanks to the efforts of Stern Pinball. People coming to the Midwest Classic will have the chance to not

only play the large collection of pinball's on display (all set to free play!), but will also have the chance to purchase them and take them home as well. The unique experience of flashy art, blinking lights, exciting sounds and clicking bumpers is something nobody should miss the opportunity to see once again...or in some cases for the first time! Thanks to Stern Pinball (www.sternpinball.com), some of the many prizes given away will also include rare pinball artwork, promos, and more!

Doors will be open to the public from 10am to 8pm. Advance ticket sales (Adults $6.00, children 12 and under free) and more information are available at www.midwestclassic.net. Tickets at the door cost $8, children 12 and under are still free! For press releases, participation information, or any other direct questions, please contact Dan Loosen at (414) 429-5285 or Marty Goldberg at (414) 678-7095.
The Midwest Classic is a non-profit event.

Thanks Rick.

I did get a straight cable but no benefit.

The drive was set to D0.
I hit the reset button out of curiosity and impatience.
Tried both single and double density 5.25 drives.
I found the manual.

No luck to be found , yet.

I think my next option is chip replacement.

Source record: 21578

My brother gave away all our Atari stuff to a girlfriend years ago, the rat, and I've begun going crazy trying to remember all the games we had. There are three in particular that are bothering me, maybe you guys can help.

1) A pac-man style game where you collect dots on a HUGE map. There's a magnifying glass over the section of map you're in to let you see where you're going. On the left and right of the map are pictures of the bug-things that chase you. When they catch you, the pictures wiggle and a digitized voice says 'We gotcha!'.

2) An overhead adventure game where you control 8 characters in a square, each represented by a symbol. (I only remember the warrior was a sword, the archer was a bow, and the wizard was a lightning bolt.) The enemies are scary insect things that change color when they take damage. Sometimes a pit will open up underneath a character and he'll get lost in the sewers; sometimes you'll stumble across them when taking a secret passage. I think the cover featured a bleeding hand reaching for a golden chalice or something like that.

3) A weird text RPG adventure, where you move from room to room on each floor, then work your way up 4 or so floors to reach the top. It had wonderfully insane messages like 'Jumpin' Jehosephat, you encounter a giant horny toad!'. There were vague hints given in the game to a secret key combination you had to press at the end of the game to win.

I can't find any mention of these anywhere, and it's driving me insane.

Works fine for me in the 3.1 emulator. Arrow keys are a bit messed, I
have to hold CTL down, but shift+ctl+r and s+c+w work fine.

#2) Temple of Apshai Trilogy?

Good luck on #3 there are tons of text adventures.

You can probably find any of the games you are looking for at
ftp.spudster.org in the /pub/atari/cth/games2 directory

Nope. I remember Apshai, too. You control a party of 8 characters. There was a command to rotate your guys clockwise, counterclockwise, and I think a command to switch two people.

And yes, I don't have high hopes for #3. It's probably pretty obscure. But it drives me insane because I can almost remember the silly messages it had.

OTOH, the more spread out everyone is, the harder it is for us to find
each other. :^(

I don't have the time or patience for web-based forums, and my newsgreader
(TIN on my ISP's Linux shell) is great... it does threading, and they've
got good spam filters running behind their newservers.

In most communities (gaming, classic gaming, Linux, graphics, etc.), there's
much more room for multiple 'hang-outs.' With such tiny communities as our's
(c.s.a.8), there are too few people to really make it worth it. :^/

Just my opinion...

1) Write your code, include the RUNTIME in your code (with cut and paste or
INCLUDE compiler directive)
2) test your code with the cart until it works ok
3) save the code, make a backup copy :)
4) clear the editor buffer (for a lower startaddress of the pgm)
5) enter the ACTION! Monitor SHIFT+CTRL+M
6) Compile the Source-File C"D1:filename.ACT"
7) Save ML-File with W"D1:filename.COM"
8) switch off atari, remove cart, boot, test Programm
9) if it fails somehow, start at 1)

Have fun :)

None I'm aware off.

Using cc65 EM-Drivers would be nice. It's a good design and cross plattform.
Can also be used cross-language.

See http://www.cc65.org/mailarchive/2002-11/1841.html

If you like to implement it, I would assist.

Ciao

Frogger was redone by Hasbro Interactive when they owned Atari rights.

Centipede was redone, too. I forget if it was Hasbro. Probably.

Space Invaders wasn't an Atari title. ;^)

> So the name recognition and reputation, and the
> names and concepts of classic Atari only games,

Yes, that's the one. In the Netherlands the system is named "Philips G7000". I remember cause I read about the suing the next day
I bought my "Pacman" clone for the G7000 :-)

Action! has some issues when compiled into a disk file. The problem is that
it sets the init vector ($02E2) and not the run vector ($02E0).

One supposed solution is to put:

BYTE RTS=[$60] before your first procedure. I've had mixed results using
this. The proper solution is to break out DiskRX and hex edit the the last 6
bytes of your file so that it sets $02E0.

I think you're only limited by the amount of free memory. 64K would be the maximum array size, but there's no way you can get that anyway.

# 2957. Re: ATR 8000 Diagnosis

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-21 22:26:43 UTC
From: Bob Woolley <ataribobdelete@alamedanet.net>
Message-ID: <3ecbfd8d$0$22739@fountain.mindlink.net>
Source record: 21470

The 1797 has a True data buss - the 1795 has an inverted data buss. This will make the data unreadable, but the drive should seek, format and like that....

A 2797 isn't even close. Pin 40 of the 179x is +12 volt power. The 2797 will probably not like that.....

Bob

news:3ecba533$0$49110$e4fe514c@news.xs4all.nl...
> Is there a lib. for ACTION! to use the extra memory? Something that
emulates
> linear memory for array's?

Not that I know of. Extended memory is not that hard to use from Action! as you can do the same peeks and pokes to window memory that you would use from BASIC/Mapping the Atari.

What I did was used the set directives to position the runtime at the same location for everything and compiled modules that started at $4000.
Something like
```
set 14=$2000
set $491=$2000
include "D:RUNTIME.ACT"
set 14=$4000
set $491=$4000
;module code here
```

When you save this from the monitor it *only saves* the portion from $4000 to program end. Of course all the module references to the canned routines in the runtime package are right.

The mainline code was just
```
set 14=$2000
set $491=$2000
include "D:RUNTIME.ACT"
```
Followed by the mainline code with a few routines here to handle bank switching and loading the modules into banked ram. You also have to declare where the routines start. I can't recall if I picked them off as part of the load process or just used a monitor to find out what they were.

Ok, this is totally off topic.
The best cereal in the world was destroyed by
Nabisco.
It was from Purina I think and was 'Wheat Chex'.
Nabisco said it used 'Shreaded Wheat' technology
and sued them.
'Wheat Chex' was changed to what it is today, nothing
like the original 'Wheat Chex', (imagine a toasted
brown, not dark burnt, but brown, shreaded wheat
about 1/2" square.)
I was about 9, so only Rick Cortese would remember
it 50 years ago. No offense intended, just guessing
Rick's age.
Russ

Russ Gilbert <russg@en.com> wrote:
> Uhm. Bill, what's he gonna search for?

"+robot +demo" on the current (aging) XL Search seemed to do just fine. ;^)

It found "robotdem.dem", which is an executable-program version of
the demo. (e.g., "[L]oad" from AtariDOS, or run with
"atari800 -run robotdem.dem" under Atari800 emulator, for example.)

Sadly, most FTP sites don't bother _describing_ files, which _does_
make searching a pain. I always tried to be usefully-descriptive
back when I was maintaining the UMich FTP archives. :^/

That was a bunch of satire, not "o.t." Pretty dry satire at that.
But then, that is what happened so many times in the computer and
gaming worlds over the years.

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,pdx.forsale

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==

Thank you for visiting the forums my rainbow hued friend. . . :)

I agree that the forums are a bit underutilized at this point, but that's where you all come in. The Atari message area is set and waiting for participants to come and share their knowledge.

Some of the other forum areas have generated a fair amount of interest and all of the areas are expected to continue to grow.

I started the VC Forum as an ad-free, charge-free, privacy protected service to the general public just a few weeks ago. Since it's inception we've averaged over a dozen posts a day from many of the 50+ registered users and, based on the logs, we get many more lurkers then posters.

This newsgroup is still the place for Atari 8-bitters, but I do hope that many of you will visit the VC Forum as well to share your knowledge there. I've never had any designs on hindering newsgroups, mail lists or other venues with the forums, I'm just adding another communications tool to the toolbox.

Best regards,

Erik Klein

Message-ID: <baj244$oic$1@hercules.btinternet.com>
Source record: 21482

have you tried some of the other books on http://www.atariarchives.org/ like "de re atari" or "mapping the atari"? They may have something tucked away in there that could help? I don't think the technical reference manual had much more in it than these books? Is it the scanline timings and when the dma fetches happen you are interested in? I think I still have the technical reference manual around somewhere. Let us know what aspects you are looking at and I'll have a look if you like.

Regards

Dean Garraghty

## 2971. AtariSIO V0.20 beta released

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-22 19:34:05 UTC
From: Matthias Reichl <usenet-20030522@hias.horus.com>
Message-ID: <slrnbcq9ha.dbh.usenet-20030522@camel.hias.horus.com>
Source record: 21484

The new version includes the following enhancements:

- support for DCM/DI/XFD disk images
- transparent (de-)compression support through zlib
- devfs support in the kernel driver
- support for non-standard SIO2PC cables (using DSR instead of RI)
- added 'all' option to several atariserver functions
- several minor bugfixes and improvements

AtariSIO can be downloaded from my homepage

http://www.horus.com/~hias/atari/

so long,

Hias

## 2972. Free SIO2PC cable in UK

Newsgroup: comp.sys.atari.8bit

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, avoid making promises I cant keep and avoid offering services I cant follow up on! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or http://BenSells.Atari.org or Call Ben@(503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

http://www.aracnet.com/~atari/shipping.htm How I can save you Money!
http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

Dear Atarians,

Ben Smith has been a loyal supporter of our community for many years. He furnishes a vital service for all serious Atari hobbiests in his support, service, and sales. I have bought dozens of items from him over the years and have never been disappointed. Ben Smith is the greatest!!

Sincerely, An Atarian Forever

## 2979. atari s/w for sale

There's one on Ebay right now, don't know if it has the switches. Really the write enable switch can be done seperately. And the slow/fast can be done with software. I believe the Happy backup software and DOS automatically engage the fast mode. I have one with the switches and I rarely ever need to use the fast switch, it always goes into fast mode when I boot up the warp speed DOS.

ATR-8000 works with all A8 ataris and OSes.

Schematics..I've never found any, though there was a rumor. Could use
them for a couple of dead ones I have.

Usual problems..chips need seating, cpu, ram, or power supply regulators,
then the eprom.

Also try booting the A8, turn on the ATR with a generic printer attached
and see if you can print to it properly. If not, then its not the floppy
controller. Testing the modem port is doable but more complex.

I have never had to press the reset button when I turn the ATR on. Only
when I need to reset the drives or clear the printer buffer.

Make sure there are no SIO attached drives with the same numbers as the
ATR attached drives. Same goes for ramdisk. But, the powered drives will
reset when the ATR is turned on.

There is also DVC65(Keyworks Softsystems).

As far as I know all C language implementation for the A8 were subsets of full C. I don't know of any that include the struct command, though I am not very familiar with Lightspeed C. Given time, and banking, a full C could have been done, but, porting programs wouldn't work..just not enough ram compared to newer(at that time) systems.

I have a Canon BJC4100 that works great with the A8 since it defaults to epson codes. I have not done a lot with graphics printing yet.

I also have a HP DJ500plus. With a driver I use it with Paperclip. With the FX80 cartridge, I can use it with all commerical programs looking for an epson.

The only thing to note is that "skip perf" is different(there is none), so use legal paper if you can't set them to zero.

While a line doubler is simpler, taking each input line and displaying it on two lines vertically, an up converter does that and increases the horizontal resolution, 640 to 1280 if needed, it may also allow refresh to be changed, pal to ntsc.

# 3004. Questions about ATARI Game Cartridge: Pac-Man CXL4022

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-26 12:24:27 UTC
From: jrclas@canada.com
Message-ID: <f4b9cb1e.0305260424.7208b487@posting.google.com>
Source record: 21317
Cross-posted to: comp.sys.atari.8bit,alt.atari.2600vcs

While cleaning up this weekend I unearthed a 1982
vintage ATARI Pac-Man game cartridge, part number
CXL4022. The game console is long gone.
Here is a picture of the cartridge:
http://www.geocities.com/jrclas/atari-game.html

I think it came from a model 400 console.
The questions are:
- What other consoles does it work with?
- Does it have any value to a collector?

Please reply here or e-mail me at:
jrclas@canada.com

Thanks
JR

That is a cartridge for an Atari 8-bit computer (400/800/1200/XL/XE). I doubt its worth more than a couple of bucks. It's a common game.

The ATR is an SIO device and impartial to OS version; works just fine on the
XL models. Never seen a circuit diagram...

Do you ever use an 810/1050 as D1: in concert with the ATR8000? My ATR seems to act like a Percom and refuses to accept any drives besides its own as the primary D1: boot device. Even when not powered on, it does not pass the boot signal down the daisey chain to a D1: 1050...

I was unable to access the image page, but I have three of those 4022 carts in the boxes from TG&Y store closings in the '80s; they were cleared out for $2 or so and I have been unable to give them away. They are compatible with any 8-bit Atari Computer 400, 800, 1200XL, 800XL, 600XL, 130XE, 65XE, XEGS, etc...

I received some complaints about this message, posted through the
paranoia anonymous remailer.

I can't block this user for several reasons, the first is that I can't
know who he is. (that's why it's called "anonymous remailer").

What I can do is to block this newsgroup, so that nobody else will post
messages here using this remailer.

Usually I don't like to do this, especially if the problem is a single
or a bunch of messages.

But if I'll receive other complaints related to messages contaning only
insults I could take some action.....

sorry for the O.T.

# 3010. DT-80 for the ATR 8000

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-26 19:44:43 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030526154443.18689.00000236@mb-m20.aol.com>
Source record: 21323

I have a cart that came with an ATR 8000 that I got a couple of years ago. It is marked "DT-80 by Claus Buchholz copyright (c) 1984 by Amiable Computer Enhancements." I seem to remember the "ACE-80" cart, and I presume this is it or a very close relative.

Unfortunately I have no docs for this guy. It takes over the system and won't let anything on the Atari boot -- no SIO, no Parallel Port. Does anyone know anything about this cart? The odds are really high that I will never boot CPM with the ATR, but it would be nice to be able to use this cart with the Atari. I probably can modify the cart code so that it will allow Dos to boot, but it would be nice to know something about it, before I start messing with it.

Thanks,
Larry

OK, so far nothing works. I also checked voltages across almost all
the components on the board and I can detect a voltage on every piece
(I don't know if that implies those components are OK or not).

Now I also have a hard drive case that came with this, but no
instructions on how to attach it to the ATR8K. Is it possible that
this device must be attached for the main unit to work ?

Anyone know how to attach it ? I have a straight cable with a card
edge connector on one end and a pin connector on the other (like on
the back of the Percom). It appears the hard drive case (with a WD
MFM controller) would attach to the floppy port on the back of the
ATR8K , and then connect to the appropriate pins on the WD MFM board.

I was wondering if I needed to hook this up and then also be able to
attach a floppy to the WD/MFM board ?

Just looking for something else to try.

Thanks for all the help so far.

ron

# 3013. FS - Atari 800/1200xl Gear - South Florida

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-27 01:43:48 UTC
From: jgils@ix.netcom.com
Message-ID: <3ed2bf5e.18413296@nntp.ix.netcom.com>
Source record: 21326

I had these items "sold" a few months ago, but the buyer never showed.
If you are that buyer, post a response if you're still interested and
I'll contact you.

The following is offered for $100 as a complete package only:

1. Atart 800 PC - with power supply
2. Atari 1200XL PC - with power supply
3. Atari 1027 Printer - with power supply
4. Atari 410 Program Recorder
5. Atary 1050 Disk Drive - with power supply
6. Atari 810 Disk Drive - not working
7. MPP-1150 Printer Interface
8. Star NX1000 Printer (9-pin dot matrix)

Also included are cables, joysticks, paddles, trackball, etc. There
is some software and a bunch of manuals, but consider this to be
primarily a hardware-oriented package. Everything (except for the
810) was in working order when I packed it in 3 boxes over a year ago,
so I can only sell it now "as-is". I have no reason to suspect that
there's been any damage as the boxes have been undisturbed in my
garage since then. Based on what I've seen on other sites, one of the
main selling points of my package seems to be that I have all of the
original power supplies intact.

If you're interested, email me and I'll send you photos of all of the
hardware before I packed it up.

I'm in South Florida, so personal pickup will save what I'd guess
would be $20- $30 shipping (all those power supplies are quite heavy).

IIRC, the "DT" stands for Dumb Terminal, so perhaps it works only in
CP/M mode. This would explain why they made the ACE 80 and then the
ACE 80/XL.

Hello,

A new IRC channel, #wfpc, is being opened for fans of Classic Gaming,
Video Games, Interactive Fiction, 8-bit Computers, and Alternative
Music (pop, rock, punk, etc.).

The homepage for the channel will be:

http://www.geocities.com/dunric/wfpc.html

This can also be accessed from the parent homepage at:

http://www.geocities.com/dunric/westfront.html

Anyone is encouraged to join in and participate. Potential Ops must
ask for permission, with reason(s) stated, in an e-mail to me at:
dunric@yahoo.com

Rules of use, how to join and other information on #wfpc is found on
the main page above. The channel will be through the AfterNET network,
and you can access the channel (when it is formerly created) using
mIRC or your favorite IRC provider software.

Hope to see you there!

Sincerely,

Paul Panks (a/k/a "Dunric")
dunric@yahoo.com

That's exactly what it is. It is a cartridge replacement for the ATRMON
software with software 80 column display. It is used to turn the Atari
into a Dumb Terminal for running CP/M. I think I still have my docs
for it somewhere, but it is only useful for running CP/M on the ATR.
I don't know how much code reuse you could get out of it for other
purposes.

Richard

CDs/DVDs can be 'erased'(actually, corrupted) by UV light, even the amount in sunlight. -RW discs are the most susceptible, -R less so, but even commercial pressed discs can be damaged by sunlight. -RW discs are the biggest problem, a week or so in direct sunlight will cause the dye that is used to change color and hence become unreadable (pressed discs take weeks/months, but the risk is still there - its damage to the substrate in that case, though)

Of course, if the post office is leaving your mailed discs in direct sunlight, i think you have a bigger problem than whether the data will be readable :)

As to the OP's question, usually 'Warning: Magnetic Media' on the packaging usually suffices, there are also commercial floppy disk mailing sleeves, which are probably a good suggestion too. Don't just use tin-foil, even if it works (its questionable) the risk is that it will be X-rayed anyway, and seeing a foil shield, the package may be deemed suspicious (same goes for using shielding around things carried in luggage on planes - I once had a 3DO deemed 'suspicious' because the shielding made them fear it was hiding something). At least using 'proper/commercial' disk sleeves, the level of suspicion will be lower.

## 3029. Weird 130XE startup

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-28 23:39:35 UTC
From: Tim <tjlazer@mail.com>
Message-ID: <vdai5pi41kt363@corp.supernews.com>
Source record: 21342

I have a 130XE that works fine, but after it has been on and I turn it off, I have to wait 5-6 seconds before I turn it back on or the screen will come right back up and be frozen. (Like if I turn off at DOS prompt, and turn on again I get the prompt right there) Anyone seen this? Well its no big deal as one should wait at least 5-10 secs IMHO before turning back on. I am just curious as to why it is doing this.

Tim

Normal behaviour. These old RAM's take their time to fully 'unload' whats in it. It seems to get worse on memory upgraded
machines.

Is that all there is ? I had an 800XL that did that once, but after swapping
the PSU with my fully working 130XE, it didn't do that anymore.

# 3032. ATR 8000 w/Hard Drive Interface

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-29 13:34:13 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030529093413.19391.00000141@mb-m01.aol.com>
Source record: 21345

Interesting...

While looking through the docs of my ATR8K, I came upon a couple of sheets for a hard drive interface. Naah -- couldn't be... But I opened up one and there plugged into the Z80 socket is a daughterboard with a 50-pin scsi header. Could lightning strike twice? I opened up another and... same story! WOW!! (Sigh, the third is floppy-only -- how unlucky can a guy get! ;-)

I am not inclined to sell either one, but if someone has some equally obscure *hardware*, I *might* be interested in a trade. (?) Email me, if interested.

I've been working with it some recently. I can create working atari
executables now. There are still some questions that I don't have good
answers to yet, but overall it looks very promising.

Is anyone else using the current CC65 (www.cc65.org) to make Atari 8-bit
programs?

# 3034. Re: ATR 8000 Diagnosis

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-29 15:13:33 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <xspBa.24239$lo.1993039@newsread2.prod.itd.earthlink.net>
Source record: 21397

Not needed; my ATR8K works fine including the generic PC floppy mechanisms
without a hard drive attached. The printer or modem connections should be
functional with no other devices plugged to the ATR.

I once heard rumors of development work on hard drive capability for the
ATR8000, but never saw confirmation or even ads claiming actual
availability. In any event, it would probably have required additional
hardware and be unlikely to use the floppy connector.

That MFM controller would need a 50 pin SCSI cable to an MIO/BlackBox or
suitably equiped ATR8000. There *IS* a 34 pin mass to edge card and a 20 pin
mass to edge card connector from the controller to the SCSI hard drive
mechanism.

Well, then Steve, why pray tell, are you advertising for AVG and
grisoft??

I have been reading this group since the mid 90's, and have always
seen Ben's ads. I don't hear you speaking up against the person
posting the filth, since this isn't the place for that either.

Bottom line, apply a filter to Ben's posts, and move on with life.
There's so much traffic in here anyway, I am sure that just reading
all the off topic/spam takes up most of a day.

Besides, we evidently disagree, since our beloved atari 8bits have
been out of production for coming up on 20 years, and the fact that
this group is so limited, I think advertising wares is just fine.
There's so few people left with wares, and I am sure even fewer
willing to pay for said wares. Besides, who made the people demading
no ads, the owners of this newsgroup?? You want to filter people set
up a web discussion board, and filter away.

Isaac

The few 800XL's with 256Kb I used suffered much from this problem. I'm glad I use a black-box so I can reboot without having to
powerdown the computer every time.

Hi Ron-

> Are you going to try them out for functionality with a controller and hard drive? <

Yes, I will test them. But "when" is a different story. It's a fairly low priority. I do have MFM drives & SCSI controllers that I used with my MIO's. Maybe when the "dog days" of summer get here and it's too hot to work outside.

I have a problem right now with CC65 (and CA65). I'm linking a compiled C program with an assembler file. The assembler file only contains data (in it's own segment), stuff like fonts, a screen layout, a display list, etc. The data in the assembler file has a few labels that tell me what point each sections of data start.

My problem is that these labels in my assembler code never make it to the symbol table, thus my C code can't see or use them. I've tried using the .export and .global on the labels, but nothing I do makes them visible to the C code. (My workaround is that I know where this segment starts, and I just add the offsets to calc pointers in the C code).

Still, getting those label locations would be nice. Have you (or anyone else) ever tried this?

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, avoid making promises I cant keep and avoid offering services I cant follow up on! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or http://BenSells.Atari.org or Call Ben@(503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

http://www.aracnet.com/~atari/free_cat.html FREE Atari Catalogs!
http://www.aracnet.com/~atari/shipping.htm How I can save you Money!
http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==

You have asked me this question by mail, but your mail address doesn't seem to
work. This is also the reason why you cannot subscribe to the mailing list.
You may want to kick your ISP to fix the following problem:

```
================================================================================
----- The following addresses had permanent fatal errors -----
larryr2@bellsouth.net
(reason: 550 .net 003: you are not allowed to send e-mail to <larryr2@bellsouth.net>)

----- Transcript of session follows -----

> else) ever tried this?

Here is most of the content of my mail explaining how to use external labels
in assembler files:

```
================================================================================
If "symbol list" means the map file: The standard map file doesn't contain
unreferenced symbols. You have to specify -vm on the linker command line in
addition to -m to request a verbose map file.

Using assembly labels from C is easy. Most of the library is written in
assembly, so any problems in this area would show up quickly. Just prepend an
underline to the name in the assembly file, and declare the label (without the
underline) as "extern" in the C file. Here is a sample for a small table that
translates numbers into hexadecimal digits:
```

```
hextab.s:
-----------------------------------
.export _hextab
_hextab:
.byte "0123456789ABCDEF"
-----------------------------------

module.c:
-----------------------------------
extern char hextab[16];
...
char translate (unsigned val)
{
return hextab[val];
}
-----------------------------------
```

> There must be a way to do this, and I just don't know it. Any help is
> appreciated.

A good idea in situations like these is to look at the library source.

==========

Yes, definitely. The 850 R: interface hander that is part of the 850
emulation with the Atari++ has been assembled with the CA65.

So long,
Thomas

You fucking muppets are so busy climbing up my arse for upsetting your bum bandit chum that you are all missing the point. I would have no objections to ben advertising if he were to post a short infrequent mail with a link to an online catalouge, but he insists on posting the inventory of his fucking kitchen each and every time.

> I have been reading this group since the mid 90's, and have always

Thanks for the information. I sent a message to my ISP, so hopefully
they will get their situation straightened out.

I don't remember coming across that information in the docs (about
prepending the underscore), unless I just missed it. It might be
something that you want to add either in the docs or the faq sometime.

Thanks again,
Larry Richardson

Prepending an underline is done by most C compilers, and it's also in the
docs. See http://www.cc65.org/doc/internal.txt (this files does also come in
the binary packages):

```
================================================================================
Symbols:
--------

CC65 does the usual trick of prepending an underbar ('_') to symbol names
when compiling them into assembler. Therefore if you have a C function
named 'bar', CC65 will define and refer to it as '_bar'.
================================================================================
```

(Um... nice insult, moron. You do a great job at projecting your own issues onto everyone else, don't you?)

> We will discontinue our postings at the exact same time that Benny Boy
> discontinues his spam. He stops, we stop. He continues, we continue.

Ok. Then answer this to my satisfaction: Why? I don't want to read to your idiotic, profane stupidity anymore than you want to read Ben's ads, so you are being just as bad (well, worse, actually). Besides, he's probably not even reading these, as he's said that he ignores these posts. So all you're doing is annoying everyone else *but* the one you are pissed at. You are managing to screw up everyone else's enjoyment of this group, while *not* getting your point across to the person you are directing it to. So stop this stupid, cowardly stunt now and grow up.

> We go through *several* remailers in
> *several* countries and everything is encrypted from the source right to
> the last remailer so, good luck buddy.

You wouldn't go through all this trouble if you weren't doing something you knew was stupid and wrong, so why bother? Why not do the honorable thing and discuss this one-on-one with Ben instead of taking your ignorant vendetta out on the innocent readers of this group?

> The best method to have all of these discussions discontinued is to
> ensure Benny Boy doesn't spam any further and then, problem solved.

Is that *our* problem? NO! Go straight to him via e-mail, where you can actually reach the guy, and leave this group to what it was meant for. You do realize that his e-mail is easy to get ahold of, as he doesn't hide behind remailers like a coward...

> Why does Ben get all the fun? He's not only a spammer but a scammer.
> He's ripped-off people in our group before any of this even started and
> now he chooses to spam so no, we aren't going anywhere yet.

I haven't heard of anyone being ripped off. In fact, the only comments about his service is that it is exemplary.

> [A.L.F] .,~Atari Liberation Front~,. [A.L.F]

And what the **** is this?!?!? You really do have an overblown ego and a demented desire to tarnish the Atari name, don't you? Grow up and get a life.

My final statement on this: This crap won't get through to Ben, so give it up and let us get on with actual productive discussion rather than your stupidity.

Isaac,

My position and the position most complainants have and don't even know it is not that Advertisements are unwelcome here, it's that BEN's advertisements are unwelcome. Why? Ben is ignorant of his own customers, he doesn't listen to what people say. He posts the same damn drivel over and over again. For example his free stuff list. We've already established that it's a bunch of crap that no one wants to drive to portland for. Post it once, post it twice.. give up and ship it or toss it. Ben is an ANNOYANCE. He has no products that I would actually want to buy. I'm a scavenger.. I like to find the best deals, it's in my very nature to avoid stores like that. Probably most atarians are similar. Combined with a rather stunning reputation of atari (16/32, can't vouch for 8bit), sellers on ebay, I don't have a reason to ever turn to ben. plus I know mouse_master who bought out toad computers and has boxes and boxes of replacement IC's and such. I know Stimpy who has some replacement parts I could buy.... you know it's just pointless. You can pick up most any 8bit machine off ebay and most of the mods are DIY. So who cares?

The problem that people have with ben is that they never see anything new, fresh, exciting or different. The ads are the same, formatted the same,

filled with exclamation points and whiz bam deals and 20% and 30% and it just sounds rediculous. He sounds like a #$#%@! vacuum cleaner salesman. That's why people hate it.

Most people who do all out advertising on here come on. They're short, to the point and say what they have. i.e. "auction on ebay" followed by the link. Or "Check out my new site". I've looked through Ben's catalog. There's nothing I want. It's not like there's going to be an absurd amount of new readers to the group daily and if someone is looking for a damn atari store, they'll go to groups.google.com and they'll type atari sales or atari store and guess what. they'll find 8bazillion ads posted by ben. But if he posted one every 2 months, they'd STILL find him.

Not *everybody* has a mental deficiency. So why make everyone suffer. I'm not going to filter this group or any other I read. It's about principle. I'm only now just getting to the point where I'll do anything more than add an rbl to my email server.

to put it simple. NOBODY is going to make a constant profit from atari 8bit or 16/32. But if you want to try it like B&C, fine, but at least don't be so absurdly annoying about it. Say it, don't spray it.

Alas I'm wasting my breath as Ben will never change. But at least reasonable people like you should understand what's really wrong (at least from my perspective).

Mark

Well, that's the first time I have seen this requested. I thought he
was to stop posting altogether. I'll admit, years ago, I thought his
list was quite huge, and a nuisance, but over time, it has dwindled it
seems, and with fewer people hawking wares, I don't seem to mind it
anymore. Has anyone even bothered to just ask him to post a link to
his site?

> As i stated above, group ethics are on topic, spam is off topic.

I think to be consistent, you should be speaking out against whoever
is posting the filth. It really makes your cause look off kilter when
you don't apply a level base of tolerance.

> > Bottom line, apply a filter to Ben's posts, and move on with life.

> Do you filter everything you disagree with or do you do something about it.

No, with the 20 posts in here on a good day, I just hop over the ones
I am not interested in. For instance, I don't own a Black Box, so I
don't spend too much time readng the posts about them, or getting
pissed because other people are making such a fuss about them. If
Ben's ads were annoying to me, I would filter him, and do filter
people in other groups. It's just the nature of usenet. When someone
is on tv spouting something you don't agree with, do you change the
channel, or launch a crusade against the tv station in hopes of
squelching your perceived enemy?

> I dont want to filter anyone, that was your suggestion!.

Well, by insisting that Ben stop, not only are you filtering Ben for
yourself, you are trying to impose your filter on everyone else.

> --
>

It's much easier having an intelligent conversation. I honestly was
expecting a post telling me to ram a cartridge up my keister. I guess
it's just taking whoever is making those up, a while to gather his
thoughts, and tap out the message with the pencil in his mouth. Sad...

## 3056. Atari 600XL factory 64K?

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-31 02:05:11 UTC
From: Roc <roc@roc.com>
Message-ID: <45UBa.825$H67.183115@news20.bellglobal.com>
Source record: 21420

I seem to recall buying an Atari 600XL with factory installed 64MB. Did
Atari sell this later on with 64Mb ??
and are there any 64Mb upgrade cards available for 16Mb 600xl's????

Is there any adapter that allows you to plug the RF connector on the back of the Atari (and many older game systems) to the Video / Left / Right audio RCA jacks now standard on most newer TVs?

The Atari computer had a monitor port that had a composite video and an
audio connection which could be plugged into these RCA jacks on your TV.
Of course if you are talking about another Atari product such as the
2600... you're in the wrong group. ;)

I do remember a 5 pin DIN connector, which was labelled Monitor...but this
is not a standard connection is it? and did it output to RCA jacks?

Well, I don't normally reply to stupidity, but I did. Please forgive me for contributing to the destruction of this Newsgroup.

My advice (which I didn't follow): Don't respond directly to these losers slandering Ben Smith and calling themselves the "Atari Liberation Front" (i.e. don't try to discuss this with them). They have shown me once again that stupidity cannot hold a coherent conversation. They sent me a personal threat e-mail in response to my last post - one full of overly repeated uses of "f**k", "s**t", and "fagboy" in reference to me, and promising pain and a "lesson". They obviously have mental deficiencies that prevent them from rational thought and peaceful, honest conversation.

Does anyone have any other ideas on how to get rid of this filth? I'm sick of wading through this to get to real meaningful discussion. Perhaps if we put our heads together we can come up with something. Their threats are obviously empty ones (besides maybe faking our personal e-mail addresses as their own in their posts), and there's obviously nothing they can do to the entire group if we *all* get involved and get this problem solved.

Any ideas? Ignoring them won't work in this case, as they are basing their posts on Ben's continued posts (which I personally welcome - just my personal view...). Other alternatives must be followed. I think this is the only thing related to these posts that is really worth discussing here. Thanks!

Actually I think you both are mistaken. Looking at the mails that he
actually wrote (rather than the regurgitated spam he sends out) allows one
to get an idea about this man. If I wasnt convinced that I know who it is
who is actually hassling him, I'd be thinking that he was doing it himself
to generate the attention. What I am sure of is that he does read all these
emails, he wouldnt be able to resist, in fact he even replied to one a while
ago and his reply said that he doesnt read them....

> I am not interested in.

But there's the chance that one day that person you just filtered will have some usefull and welcome input, i may well use his services one day, i may well join a conversation with him, i'm not objecting to him or his living, but only when he stops his multi page spamming and replaces it with a short mail with a web-link will i let ot go.

Just ignore the powerless dick(s), they (if it's more than one mofo's
which I doubt) just fill the group with filth designed to show how
powerful they are and yet the fact that they can't stop their arch enemy
posting just proves how f**king useless they really are.

Dickless morons incapable of that little act so they stamp their feet
like spoilt little kids just to prove if they can't do the job in hand
and that they can cry like little girls as loud as possible while hiding
behind their nym, dizum etc places.

Very powerful...<shudder> LOL

What makes me laugh is how stupid they are, even if you find Bravo's
adverts a little too often as I do but say stop filling the group with
foul abuse you get called a 'Benny Boy' fan.

How f**king stupid is that, it just shows the level of reasoning behind
their thinking. This ALF thing isn't about keeping the group free of
spam, its about filling the group with their spam in some form of
competition.

Lusers

The best move is to add kill filters to both mail and news using the
below addresses, update them ad they swap around.

@nym.alias.net
@Gilgamesh-frog.org
@dizum.com

While the mails are PGP encrypted and routed via various remailers the end result is that only a certain number of free remailers do both news and mail anon so their options are not as big as they lead you to believe.

Hello,

I have seen this before with my XE and my larger Atari Hades
computer. Sometimes you have to wait for the memory to clear. It
is a good idea to wait about 1 minute before turning it back on.

Source record: 21435

Hello,

I am still trying to get Contiki to work. I started using the Contiki.com file with an 850 interface and got no results. Chris suggested using either the DCM or ATR version of the program as they have proven to work better with DOS. I will have to convert them to a DI image as I am using 800xlDJ with my Atari clone, the Hades060. Hopefully I can get it working.

# 3074. Has anyone gotten Questron working on any emulator besides Apple where you can actually finish the game?

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-31 12:40:58 UTC
From: Sean Whalen <askme@nospam.com>
Message-ID: <lj8hdvcn2cqk7f7gedffh2k03pjecmvi3f@4ax.com>
Source record: 21437

'm trying to play the original Questron through emulation. I first had this game on an Atari 800XL, it was one of the first major computer RPGs I remember playing besides Phantasie, and I came close to finishing it but never did for some reason. As I remember I was in a dungeon in the Land of Evil somewhere, I'm guessing Mantor's. Over the various years I've tried a few copies on a few different computer emulators. First I tried a version of Questron I found through the XL-It Atari search engine, it wouldn't get past the character select screen. Next I tried a Commodore 64 version from arnold.c64.org on CCS64. It worked fine, except for the gambling. For example in Roulette you couldn't put in a bet and all you could do is select Even and Odd over and over and there was no way to leave the screen. Eventually I downloaded an Apple version off Gamespy's site which seemed to run fine on AppleWin. But, the Apple version has the least asthetic graphics. :)

I then pretty much stopped looking and never got around to playing it. Years later, I saw a post on this very newsgroup which is still here in my Agent newsreader about Holme's site closing down. On there, I found an "alternate" version of Questron which has a cracked screen at the beginning. This seemed to work great, until I finally started to play a bit more and tried to enter my first castle. When I inserted disk 3 as instructed, the game crashed to BASIC with a message "Stopped at Line 3000" or very close to that. I was using Atari800Win PLus 3.1. I tried various settings to no avail, so I'm assuming the third disk is bad.

Now to my question, has anyone gotten Questron working (all the disks) on any emulator with all the features like gambling besides the Apple version, and if so could you tell me what emulator version you were using and the version of the disk image you were using? I'd settle for Amiga at this point, if that even exsists and the graphics are better than Apple's. :) I'd really appreciate it. I could offer one of my many ROM and disk image games in exchange, I have a lot from Atari to Super Nintendo and even Genesis. :)

# 3075. Holmes replaced Atari, with, SEGA???

Newsgroup: comp.sys.atari.8bit
Date: 2003-05-31 12:49:13 UTC
From: Sean Whalen <askme@nospam.com>
Message-ID: <f19hdv8nsgsrevfmtn6kv1k6fv4nv8v878@4ax.com>
Source record: 21438

I'm sorry but I thought the whole reason for Holmes shutting down his
Atari site was lack of time and/or money to run the server. Now I see
the site's still there, but it changed to, Sega??? He's free to run
whatever website he wants, but if he was having legal issues or some
such with certain people over Atari disk images he could of at least
been honest about it. Or if that wasn't the case he could of just
left the Atari site up, he obviously has server space and it's not
like the files take up much... I'm sorry, I just don't understand,
just seems like he abandoned Atari like a lot of other people.

My apologies, just seems to be very few Atari disk image sites
anymore. Even the mirror of Yogi's site I bookmarked gives me a
"Permission Denied" message now. It's just frustrating, especially
when you find out a game you thought was running well actually wasn't.
My offer stands though about the disk image or ROMs. Whether you help
me or not. If anyone needs anything just ask. I'm no friend to the
IDSA or any other organazation against "abandonware".

This is an overzealous statement. If this ass manages to destroy the
group I would be more than slightly surprised. Considering Atari as a computing
platform has survived massive pirating, corporate death... and hey. MagiC
crashes too often.. that alone would be enough to make some people I know
give up and boot linux, I don't think there's really anything to worry
about. All this talk about death, destruction, blah. Nobody realizes
that the Atari community as it stands right now is THIN. I only pray that
there's a lot of dumb people having Falcons hiding shrinkwrapped in their
basement ;)

In fact the proper attitude for dealing with people like this is to
*actually* not care. Everyone can just "ignore" the bully, but if you're
sitting there fuming, the bully will still know it. As it stands he has
only one enemy, Ben, and has just one reason to post on a semi daily basis
(alongside of Ben's ads). If everyone starts attacking the hell out of
him we'll have to read that stuff (which is admittedly much worse than
ben's ads) all the time. No fun.

> Does anyone have any other ideas on how to get rid of this filth? I'm sick

We all know the arguments about Ben's posts. They're unwelcome into my
world. As for stopping this guy? I'd say less than possible other than
distributing a killfile for as many anonymous remailers as we can find. I
don't support killfiling ben - he should listen to his potential customers
and change things a bit... at very least, it would be good business sense.
Unfortunately the whole idea that you can't stop one person from crushing
a group with crap is part of the (in)famous beauty of usenet.

Source record: 21443

Holmes has been recovered at:
ftp://atari.xs4all.nl
user: atari8
pswd: atari4ever
However, I can't get it to download from the site with
a shell account, IE 6 or Netscape 7.
It has about 7 Questron files, BASIC ones and
3 zip files.
The problem you may be having is that the crack
of a copy protected program doesn't work entirely
right. You say you can get the disk 3. Often a person
who cracks a program doesn't see that it can play
all the way to the end.

64 Megabytes???

> Did
> Atari sell this later on with 64Mb ??

I guess you mean 64 Kilobytes, not Megabytes. AFAIK all 600XL's are 16 Kb. They can easily be upgraded internally to 64 Kb by
adding a multiplexer and replacing the RAM's. Maybe some retailers did this trick too at that time?

> and are there any 64Mb upgrade cards available for 16Mb 600xl's????

The Atari 1064 is the 64Kb memory expansion for the Atari 600XL. In fact, it replaces the internal 16K with external 64K when it's
plugged into the PBI port. There were also some 3rd party companies making expansion like this. I know of a 128Kb version but
never seen it myself. (was that made by Axlon? Wiztronic maybe?)

Yes, such a thing exists, but it's not just an adapter but a converter. For _most_ Atari's you don't need this converter since the
monitor-din-connection on the back of the computer provides the signals you need to feed the RCA's (or SCART) on a modern TV.

See my site at:
http://www7.brinkster.com/atari/pinouts.htm#pinouts
for more info.

You may also take a peek at the faq, since everything you asked is in it.

Nope. Sorry, the Atari 400/800 plug (detachable on the XL/XE) is a 75 ohm RF signal which with the proper adapter will connect to your TV's F-type coaxial cable jack or to an older TV's 300 ohm screw terminals.

The 800, 800XL and 130XE have a monitor jack which delivers the composite video and audio signals for those RCA jacks on the TV. Check Fox's site for the pinouts; it is very simple to build the DIN-5 to RCA cable you need.

The DIN-5 to RCA was fairly standard back in the day; both C= and Atari had cables available from several sources and that commie cable worked fine on the A8 - especially to the their 1702 monitor. The original PC and XT used a DIN-5 for the keyboard connection; you might cannibalize one and add the RCA plugs.

FWIW: The Atari versions of at least 2 of the old RPGs wouldn't run on a real Atari. They played to various
stages of completion and then crashed.

I bought copies of them from San Jose computer when they deeply discounted
their 8-bit software to ~$5-10 each. Ended up having to buy the ST versions,
which actually worked, to play the game through.

I would suggest you look for an ST emulator and try to find that version.

Here's the problem.

Over the years Ben has responded to several suggestions made to him about his posts. For one, I emailed him about some simple stuff: When he first started crossposting to several groups made it unecessary post to each group individually. It was just a simple mistake and he changed his posting so 3-5 identical posts did not show up in all the groups.

Several reasonable people were also able to reach a compromise with him. Since they were not interested in his sales Ben prefaces all his posts with ADV for advertisment in the subject line. This made it easy to filter all of his posts even if he changes his email address.

Indeed, I suspect there are a lot of people don't even see Ben's posts because of the compromise reached.

Now you have a self appointed net cop who violates just about every rule of ISP TOS agreements. His time is limited since there are only about a dozen anonymous remailers. Things like deliberately defeating newsgroup filters by constantly changing your posting name, identity theft, etcetera, are all violations of TOS. Even anonymous remailers have rules.

It isn't that I particularily want to shut him up. He is free to rant as far as I am concerned. I just that I could ignore his posts with simple filtering. Like preface all his posts with ADV or RANT or something.

It really doesn't matter though. Soon as he burns his bridges with the anonymous remailers it will end.

Sensible reply, there are only so many anon remailers (last time I counted maybe 15 I found that were stabel) , and they can all be gradually blanked in a kill script.... good idea

Anyway as we are Atari users, and I presume we have nothing to hide (grin) why would we need to use an anon remailer in this group?

WOW, thank you so much for telling me. I always thought I somehow
broke a lot of games and I had no idea why. Maybe they just didn't
work right. And thanks for the Atari ST version info. I'll look into
it! :)

Okay, thanks for telling me. I had a lot of old games that I thought
I used to break, maybe they just didn't work right. In Search of the
Most Amazing Thing was one of them, I owned it twice and both times it
kept dumping out to BASIC eventually. I'll look into the ST version,
thanks for the info. And sorry if this posts twice, but I thought I
had posted it and it's not showing up and it usually does right away.

Well I got an Atari ST emulator working, Gem2000 from emulators.com.
Never saw an Atari ST, even has a desktop, pretty cool for an Atari.
:) Now finding the game's another issue, nothing's turned up so far.
If anyone has it or knows where I can get it, let me know. I'll keep
looking, but I'll settle for the Apple version if I have to. :)

BTW there were two Questrons, I'm looking for the first one. I don't think that was released for the ST, only the second one. At least that's the impression I'm getting. And the ST looks like it was a later system in the late 80s, while Questron 1 was 1983, I just did a web search to see. It'd be unusual for SSI to port an old game over to a newer computer. But thanks for trying, I think I'll stick to the Apple version, seems the most reliable. I just hope it doesn't have a bad disk too or anything. But if anyone knows another version that works reliably, let me know.

Never seen those, never heard about those, but it's possible of course. But I guess those were expanded afterwards, not in the
factory.

> I 've seen some schematics for a 64K upgrade which seems pretty easy to do.
> now just to find those chips

I don't think that will be a problem. The RAMs where very common, so I guess they're still available. The multiplexer is a
standard component too, so also no problem.

Source record: 21364

The cable I have is just four RCA plugs on pins 1,3,4 and 5, with pin 2 as a common ground for all of them. This is coincidentally the same pin that Atari uses as a ground (see http://www7.brinkster.com/atari/pinouts.htm#monitorpalntsc ). Just use pin 3 for audio, and pin 4 for video. Leave the other two unconnected. Works for me.

## 3102. Distressed XF-551s

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-01 04:49:48 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030601004948.04553.00000213@mb-m21.aol.com>
Source record: 21365

I have two "distressed" XF551s, and they both exhibit similar symptoms.

Both have +5V and +12V.
Both mechs will seek when power is applied.
Both will boot maybe 1out of 20 or so times and read a disk perfectly when they do boot.
Both have continuity between each of the 13 pins on the SIO ports.
Both typically NAK instead of responding to the boot, and go to the self-test mode
If I boot with another drive and then try to read the directory on these XF's, the drive spins and the head moves, but the drive still just NAKs.

Any ideas/suggestions?

Thanks,
Larry

> the site's still there, but it changed to, Sega??? He's free to run

I 'dont' have anytime for the upkeep of the Atari site. The files took up over 500Mb of server space all up, and I now only have 10Mb!! Thus I put up my Sega pages which where prepared ages ago, when I had some time, as they are currently pretty small. I do sometimes wonder why I bothered running the site at all, with the bitching from people who think they could do it better, but never tried. It was up for 5 years, if you didnt grab the game in that time, too bad! There are many other sites that have Atari games available for download.

> whatever website he wants, but if he was having legal issues or some
> such with certain people over Atari disk images he could of at least
> been honest about it. Or if that wasn't the case he could of just

That statement makes me mad... I WAS HONEST about it. I did have two publishers email me with a final notice about hosting their games. I cant be bothered keeping track of games I'm not allowed to host. You may have noticed how slack I was at keeping the pages updated as it was, let alone having to figure out what games are allowed, and what arent. So I called it quits. Get the games elsewhere. What I do with my small amount of spare time, is my business, not yours.

> left the Atari site up, he obviously has server space and it's not
> like the files take up much... I'm sorry, I just don't understand,
> just seems like he abandoned Atari like a lot of other people.

I havent abandoned anything, I just happen to have a life now, and have passed the 'hosting role' to the many others out there. I still collect and actively use my Atari's when I can. But I also, as I always have, enjoy using my Sega SC3000 computers just as much. Even though the Atari is the superior computer of the two.

Anyway, if you wanted to find out my reasons, why havent you email me directly? Instead of this bitching in this group.

Sometimes I wonder why I ever bothered. People can be so ungrateful.

# 3104. Atari Magazines (and more) for sale

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-01 06:51:13 UTC
From: Anthony Iannone <aiannone@nis.net>
Message-ID: <CnhCa.24689$NC4.115363@news1.mts.net>
Source record: 21367
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Hello everyone.

I have a whole lot of Atari magazines for sale, mostly ST but some 8bit,
along with a few other items. The magazines and other items are listed
for sale on EBAY. Here is a link for the auction list:

http://cgi6.ebay.com/ws/eBayISAPI.dll?ViewSellersOtherItems&include=0&userid=aiannone%40nis.net&sort=3&rows=25&since=-1&rd=1

You can alos go to EBAY.com and search by seller, using seller id
'aiannone@nis.net'

All the goods are located in Winnipeg, Canada, and I only charge actual
shipping rates. Prices are very low (too low!)... And there is a C=64
available for all you trolls out there ;)

Regards,
Anthony

# 3105. Re: Distressed XF-551s

Larry,

Try formatting a blank floppy in the drive. If it will format and can
read and write the disk, the problem is just alignment.

Richard

not quite true. The 1064 is set up hardware wise to add 48K to the existing 16k internal ram. ie the first 16K is the internal ram, the rest is on the 1064 expantion. as you can see, the first 16K on the 1064 is wasted ram..

James

> 
> The Atari 1064 is the 64Kb memory expansion for the Atari 600XL. In fact, it replaces the internal 16K with external 64K when it's
> plugged into the PBI port. There were also some 3rd party companies making expansion like this. I know of a 128Kb version but
> never seen it myself. (was that made by Axlon? Wiztronic maybe?)

here in australia, the 600XL also has a monintor jack, tho it only has video
and audio.
the 1200xl also has a monintor jack.

depending on which 8-bit you connect it to, you will get video, luma, chroma
and audio.
800xl doesn't have chroma, 600xl doesn't have luma either.

James

Are you sure the 16 Kb ram block that isn't used is on the 1064? I thought the complete internal memory of the 600XL is disabled and replaced bij 64Kb external memory. There is even 1 line on the PBI bus to disable the internal memory so that would be the easiest way I think.

>
>
>

Hmm I have 1 64Kb upgrade looks just somewhat like the 1064. AXLON 128Kb I didn't see but I have one for my Atari 800 overhere...

> Try formatting a blank floppy in the drive. <
Thanks, Richard, but this is different. No "Disk Error" or "Boot Error" Just the NAK sound when no drive is found on the bus. I put in a "known-good" mech from a good 551, and same thing. This is a board/IC problem, I think.

Thanks,
Larry

I think you're very incorrect about how many people are hosting these
games. Why should they bother doing something you won't?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

And just take the Atari section down. You want to support Sega, even
though it's the most crappiest old PC company out of them all, fine.
Just forget about the old Atari and let it die out already. You've
pretty much gone the last few steps to that goal anyway, dumping it on
everyone else. If you bothered to keep up with the scene, you'd know
how incorrect you are about others hosting the files. You're all
talk, no action, dumping the problem on other people, just like
everyone else in the world. Really it's hypocrtical for you to tell
others to do what YOU won't. We don't need people like you in the old
computer scene, so just take your whole site down already, stop
pretending you care, and get on with your precious life. Stop coming
to this newsgroup. Then you won't have to hear anyone bitch. Or
maybe the truth is just hard for you to swallow.

That really was uncalled for. People change, lives change, companies
change, times change, and Aaron should be commended for the time hid did
give back to the community. Some people never give back anything, they just
sit back and take.

The files are available or were available on a CD or did you miss out on
that too... you could take the free time you spend here complaining
and host your own 500mb file archive just as easily. It's not that hard.

Source record: 21378

Hi,

I had the same problem. Did these drive work before?
We bought I think 10 to 15 XF551 drives in the past and they all had this problem. The problem was that the internal rom off the internal rom-mask of the 8050 cpu was defective. But there is a jumper to select a 8040 cpu. When you change the jumper to the 8040 you can use an external eprom with the XF551 OS. This did solve my problems.

So open the drive and check if there is an 8050 cpu inside.

# 3116. Re: RF to RCA ?

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-01 19:22:22 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <vdkkik2c18tma1@corp.supernews.com>
Source record: 21379

Uhm.
The question was RF to RCA.
Someone mentions an adapter, but basically the
RF isn't going to be able to plug into a TV RCA
jacks. The monitor jack on all 8-bits can plug
into the composite input of a VCR or TV. New
S-Video might be able to make a straight thru
adapter with chroma, lumina and both sides
of the sound on some 8-bits.
But the question was RF to RCA, and I don't think
that is possible, as it is a RF signal coming out of
the 8-bit, with sound, and picture all in one signal
designed for the 75 ohm antenna input of a TV.
The RCA inputs of most TVs is a composite picture,
and left and right sound.

Time to get off your high horse there champ. Nobody is obliged to do anything for "the scene" or for you. Put up your own collection for download somewhere, host it for five years, put up with a bunch of whining and criticism about how the free service you provide sucks, and then come and tell us if you still feel the same. If you do, I'll listen then.

Unfortunately, the world is full of such people who criticize something while
at the sime time expect only to get things for free without any effort on their
part. Such will never attempt to do something by themselves. Fortunately I
belog to the few who, upon seeing something they don't like or believe it
can be improved, go on and actually give it a shot (obviously, if they have
the time to devote to it).

If the drive responds to SIO by starting the disk and/or moving the head, then it is probably something in the SIO wiring. It can receive a CMD, but it can't send the ACK back to the SIO. If SIO or the controller itself were broken, it would just sit there like a box of rocks. If you had compatability or reading problems, it will "boot error" pretty much forever, not jump to Self-Test. The PCBs in these things were not mil-spec.....

Somebody should just re-do the board, maybe pull off the power supply, put the controller on a card that you can mount in a PC case and use that power supply, and make it run 4 drives at once, and maybe a hard drive or one of those cute little IDE tape drives and a CDROM.......

whoa - back to reality!

Bob

I have not heard of this before. Yes, they both have 8050's (I've not seen a U.S. version with an 8040. But they also use external Roms. I think that I see the jumper that you mentioned -- 8040 is J3 and 8050 is J4, but both are jumpered on the 8040 (S3) with an external Rom in place (U6 2364). Would this suggest the external Rom is bad?
Thanks,
Larry

Larry,

I never really worked on the the 551. I had stopped servicing the machines by that time. I do remember getting similar symptoms with some 1050's, which turned out to be the SIO interface driver chip(s). However, they usually failed totally and never worked, but I guess this could happen. I can't remember which chip it was. For some reason the number 4096 is popping into my head--maybe that's just my continuously living in a hexadecimal world. I do not have any 551 schematics, but I could dig out my 1050 ones.

Richard

Hi Bob-
> ... then it is probably something in the SIO wiring. <

Thanks for your counsel. I will get out my schematics and see if I can track down where all the SIO traces go. I've seen a lot of these puppies with broken traces at the SIO connectors. The grommets that Atari used on some XF's are pretty useless. I like stainless machine screws/washers/nuts.

I've checked SIO pin to pin on the boards, but I haven't checked from the socket connectors to the board. Suspect I need to do that next...
Thanks again,
Larry

You are well and truly out of order here...

Aaron has done all this off his own back, his own money, his time.

He's like anyone else here, he has life beyond the atari and good luck
to him, a hobby is a hobby, real life has it's own stresses and joys
which beat any game.

As for the Sega stuff, Aaron had always planned this and its his right
to do as he pleased, all ther files were made available for ages and
others have 'mirrored' the site.

Basically you are attacking a person who supported the Atari just as
much as anyone else but also put his own hard earned cash into it to
make the games available to the masses...Thats well above the call of
duty and does not deserve cheap attacks!

# 3131. RAM Upgrades for 800XL

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-02 01:45:25 UTC
From: Craig Hart <no@spam.thanks>
Message-ID: <V_xCa.1922$7E.25836@news-server.bigpond.net.au>
Source record: 21394

Hi guys...

I'm getting rather annoyed at not bieng able to run some newer demos on my 800XL due to not enough RAM. 64k no longer ought to be enough!

What's the current thinking on RAM upgrades? I've seen the 1Mb one using a SIMM (Mr wooley's, I think??), and read about 130XE compatability and CPU vs ANTIC banking issues, and want to make sure I build whichever one has proven to be the "best" in terms of compatability. I'd like to be 100% 130XE compliant, at least :-)

1Mb is way to much I think (256K should be enough!), but it's a very easy circuit to assemble, so maybe it'll do. None of the designs seen on the web are dated, so it's hard to know which superceeds what.

Any thoughts, people?

Craig

I went ahead and looked. I was wrong it is a LM3086 on the 1050. Just
some simple driver transistors.

I dont even think I'll even bother reading any more from you...
*** Plonk ***
Ah, killfiles are such a good thing. :-)

I just want to thank everyone that came to my support there. I still really enjoy the Atari, and dont have to explain, beyond what I have publicly, why I stopped hosting. I really enjoyed the visitors to my site, and all the emails I've received over the years, shows the majority of Atari users out there where good people. But with all scenes, you get a bunch of plonks as well. Enuff said.

If you still need games, be sure to visit these sites (just the tip of the iceberg of sites...)
http://www.atari8bit-software.de/index_e.htm HOMESOFT
http://atarigame.cjb.net/ Atari 8bit Games Archive

Maybe for the people that need more sites, the readers of this can post their favorite links to Atari 8bit games?

Source record: 21255

Or to be more accurate a pack of six tapes in a brown plastic case that they used to supply with each Atari 400; mostly screamingly awful games / utilities but with some dreadful music composer files on the last cassette. Also an inadvertently hilarious english schoolboy announcing "The next pwogwam is GAM4, a bwainteaser..." etc. between each file.

Crutially has anyone still got these tapes, I'm trying to find a copy!

Many thanks, Dunx

## 3143. XL Search 2.0 open for beta testing

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-02 11:11:40 UTC
From: bill@newbreedsoftware.com
Message-ID: <MhGCa.18790$JX2.1159319@typhoon.sonic.net>
Source record: 21256

XL Search 2.0 is a new MySQL- and PHP-driven remake of XL Search,
the Atari 8-bit FTP- and Web-site search engine.
(Think www.Shareware.com, but for 8-bit Atari owners.)

I'm opening it up for beta testing and so that folks can comment on it
(and help me tweak the MySQL searching code so it's more user-friendly ;^) )

http://www.newbreedsoftware.com/xlsearch2/

Of course, the old XL Search is still online:

http://www.newbreedsoftware.com/xlsearch/

Enjoy!

internal
> memory so that would be the easiest way I think.
>
yes, I am sure. I pulled apart the hardware, followed lines etc and found
that is what happens. a 64k internal upgrade of the 600xl requires the
removel of a 74ls32 and a bridge placed across 2 pins. this is so CAS? ( or
was it ras or some memory enable line?) would be switched to internal ram
for all memory addresses. also, the 1064 has hardware to dissable the ram in
the first 16K bank. I once did a little rewireing so all ram on the 1064 was
used (ie I removed the internal ram of the 600xl)

> from a good 551, and same thing. This is a board/IC problem, I think.

I had to fix a 551 years ago. atari them selves said it was the computer
playing up and left it at that. I looked at the drive, the power plug was
loose and wouldn't power properly. when i/o board was out, the solders where
broken on the power plug and on the sio ports. big holes could be seen, not
cracks. so much for atari service back then.
you could check the solder joins on the board.

James

Hello Bill,

this looks good.

two questions:

a)
if I search for "*forth*" i get several hits, but I don't get "DOSSECT.4TH -
DOS Sectors to Forth, disk utility", which I get when searching for
"*dos*". Do you know why this happend?

b) is the index-file-format still QIF? I'm planning to create QIF files for
the ABBUC Infothek and the ABBUC Programmers Wiki.

Best regards

Carsten Strotmann

In my experience the simplest adaptor to use is a video recorder. Plug the
Atari RF into it, tune it and just attach your TV to the scart / video+audio
from the video.

(smarty Russg)
I don't know the best.
There's an ICD 256k one, RAMBO I think.
Then there's the Newell 256k one, the one I have.
Andreas Magenheimer analyzed ALL extended RAM.
I believe you can find his research in the csa8 FAQ.
http://www.faqs.org/faqs/atari-8-bit/faq/
I'm sure there are total home brew ones you can
find on the internet.
The Newell requires a little module that you plug
into one of the sockets of an 800XL and wire it up.
Finally, the vendor's list, but I don't know any
Australian vendors. Active vendor's that read this
group are Video 61 and Ben Smith. B&C and
Best are other very active vendors.
There were some memory mod urls, but they
seem to have been taken down (craig lisowski's
site in particular.)

I don't have Warp OS, but my Bounty Bob works on both my 130XE and the
800XL. I have several versions, but the file version, using DOS 2.5, works.
I seem to remember it NOT working with some of the other OS's. Do you have a
file version ? Is it running with DOS 2.5 ?

That was kind of my point there. One less 's' there in my case, and
one more 'a'. (Isaac) Anyway..

> Long ago i requested that the size be cut to one short mail carrying a link
> to a website ot even an advert for a private mailing list, he responded to
> none of these suggestions and then started to post 3 or more long mails in
> a session

Well the problem I see here is that by the same token we cannot get
someone to stop posting profanity, we can't stop Ben from posting. I
still maintain that the chatter level in this group is so low that it
would only take a mere few seconds to skip over any thread that was
irrelevant to you. I read much larger groups, and as the level of
posts increase, so do the people who think they need to post their
beliefs on all manner of topics. I tend to look at posts like Ben's as
billboards along the road of usenet. They have their advantages and
disadvantages, and yes, sometimes can get in the way of a really nice
view, but you can always move on and they are out of your way. I know,
bad analogy, but who cares.

>

Sorry, I just think that if you are going to crusade, make it an even
crusade. It really destroys credibility when you will point fingers at
someone, and let another person doing the same or worse actions slip
right on by. By having an actual civil discussion here, I could see
everyone eventually at least coming to some sort of an agreement. If
we didn't have people playing childish games, then you might have a
chance for advancement of your cause. Besides, it's not like we don't

have other vendors doing exactly what you are asking Ben to do. Look
at Lance and Rick. They both have catalogs full of items, and have
relegated their advertising to web sites. They post and contribute to
the group. What you are asking isn't outrageous, but when you come on
and castigate Ben, and don't castigate someone posting filth, then you
negate your credibility. While you might have one issue in mind, you
are allowing bias to lower your ability to tackle this issue.

I only filter a few people in a few other groups, and that's because
they have been posting off topic drivel for what seems like years now.
I still maintain that the number of posts in this group has dwindled
to almost nil, and skipping over a single advertisement at the
frequency he posts it at is negligible.

> Tea Please, Hot!, 3 Sugars, Coconut Cookies, & no friggin war stories!!.

I personally don't care one way or the other. The real reason I spoke up in the first place is that the way I "saw" it, and that's previous to our conversation, is that if someone like Lance, or Rick, or anyone else established as a retailer of Atari wares posts, they would be the victim of an obscene tirade. Which at this day and age, with the amount of people with stocked amounts of Atari equipment, would be a loss in my point of view. It's not like we can pick up an Antic magazine, and search out the cheapest price on a 1024. We have to hunt down whoever might have one, and it seems that this is the arena for most of the atari activity, at least it seems that way to me. I have the feeling that if someone had an ebay auction as of late, they cringed at the thought of posting it on here, for fear that they might open their newsreader the next day to find that they have posted about sodomizing the president.

You have stated what you would like to see changed, and frankly I have no problem with that, as long as we are even handed about it. Like I said, it seems that other vendors already work in this manner.
Isaac

I get the impression that there are not many companies left, that sell Atari 8-bit equipment these days.

Bravo Sierra Computers offers Atari equipment to Atari 8-bit enthusiasts and from what I have heard, the company treats these enthusiasts (its customers) in a fair way.

No complaint in this newsgroup seems to be about how Ben Smith treats buyers of his Atari equipment.

If that is correct, please leave Ben Smith alone. Selling Atari 8-bit equipment to enthusiast users is a positive contribution to what remains of the Atari 8-bit world.

Whatever is irritating about Ben Smith and his company, it cannot be worse than all these articles about f-gs, assh-les, s-x toys, et cetera.

Message-ID: <3EDBB2B5.7A3E439C@cswebmail.com>
Source record: 21273

Hello, here is an update...

I have about 1000 extra magazines to get rid of.
Lots of Analog and Antic(no first or second year!)
Compute, Creative Computing, are gone.
Current Notes, Atari Connection(changed to Atari Explorer) still
available.
Also, Atari Interface. And Atari User if I can dig them out.

I also have some odd lots of ST magazines: Start, ST Informer, ST Log,
and ST Express.
I'll have to dig them out.

Almost all start after the first or second year..

They are free! A $5.00 per box fee and shipping applies. One box is 25

to 50 mags on average.

I am working on a list, but email me with your list.

If you email and say you want the magazines(and give no details), do you
really want all 1000?
I thought not. :) But it would make me happy!

This is sort of my point, though. The Atari community is thin. This
newsgroup has been an invaluable resource for me, personally, and I've
watched it progressively shrink over the years, and many who've jumped ship
did so because of petty things like this. Yeah, I guess destruction was a
bit harsh. It's more like erosion. The community is so small, even if a few
key level-headed people stop reading and posting, it's a definite loss for
the group.

Here's a little clue to hopefully get ya going again without giving away too much:

Much like in ancient myth, The Minotaur is in a labryrinth underneath the island of Crete. According to some ancient legends Theseus beat him with the help of a King's daughter, but most of the warriors available should be able to do it... I like Achilles or Autolycus, myself.

If this doesn't help, let me know and I will be more specific. I made a mini gaming guide and character chart for this game, much like I am working on for another Ben Smith title, Ali Baba And The Forty Thieves. I plan to release both mini-guides along with a NeverWinter Nights module based on Ali Baba, due out (hopefully) later this summer.

Ugh. No idea. I'm only just learning about MySQL, and the stuff I've seen
on 'FULLTEXT' searching hasn't been very thorough.

Anyone here good with it? Can you help? ;^)

> b) is the index-file-format still QIF? I'm planning to create QIF files for
> the ABBUC Infothek and the ABBUC Programmers Wiki.

Yes. I may decide to come up with my own format that people can choose to
use instead, too. QIF is pretty useless, honestly.
It's not even Y2K-compliant! :^P

One thing I've been considering, too, is (slowly) downloading every
archive file (ZIP, ARC, etc.) on sites to examine the insides, and then
keep a list of what's in the files in a separate table.

This would also help for when there's a ZIP that contains only an ATR file.
Then I can create an icon for a compressed ATR disk image, and put it up,
rather than an ambiguous icon of "some compressed file(s)", that I have now. ;)

That might be XL Search 3.0, though. ;^)

D'oh! What did you search for, out of curiosity? Right now, if it
comes up with 20000 matches, it'll try to show them all in one page
(which means in one table). :^)

I think I should fix that ASAP. :^)

> Good stuff!

Thanks. What do people think of my Atari-themed interface?
Does it look cool? Or is it just annoying, and not worth the 'retro' factor?

I like it, but it really is taking me a while to get used to blue-on-blue
rather than black-on-white. ;^)

Hello All,
I've got a problem with a newly acquired 800XL. It powers up to a black screen 19 times out of 20. If it boots fine, then it'll run fine for hours. After attempting chip swaps without any success, I tried digging a little deeper. I discovered that I could toggle the CPU's reset pin (pin 40) and the unit works just fine.

Does anyone have the 800XL schematics that could give me a hint as to the reset circuit? I'd like to trace it and see why it's not working fine.

Any suggestions are welcome. Thanks!!

All of my versions used to work on my XEGS but they all packed in when I
upgraded to warp. I believe one problem is the fact that my machine is a UK
machine and the Warp roms aren't.

That was a cool shop! , In my youth we used to go down to Sidcup and just play games all day in the shop , sometimes we even bought a few! , Aztec Challenge 2 seems to stick out for a long sessions of play back then, but I don't remember the cassettes you talk about...
However there did use to be a cassette only magazine that came out attached to a bit of card board that I remember buying once a month for a while , but I cant remember the name of the 'mag', It had loads of bizarre games/tools etc that also had some bloke talking on them from time to time. anyone know the one I mean or have any images of those cassettes ,that would be cool...

I am looking for an Antic Magazine in which the front cover has a family
that is out camping with an Atari computer in the background. I believe the
wife was cooking some fish on the campfire.

One of my favorites actually. An original, and it gives me good memories.
As for it's value to a collector, you bet it's worth something!!! You found
a real
gold mine too!! I believe the last one I saw was going for as much as
$1.50.

I recommend keeping it, it should be worth more in another 50 years.

A fine game. It was the Ultima series that inspired my desire to learn computer programming.

After Ultima 5 though, the series took a real spiral downwards. I did not like the new format at all and just did not bother with it after that.

Did anyone play Ultima past 5 and like it? Do you have anything more to say on it?

well, it's just that australians with 8-bits are very few, those that still
use them are very rare.
where in this great counrty are you? I am from brissy. happen to have the
super products 8-bit range here.

I don't have the tapes although I do remember them being as awful as
you say :-)

Loved Silica shop, used to go to the Sidcup one every saturday for a
slice of heaven. As you walked in the door to the brown interior the
serving area was alive with sound and vision, Pacman, galaxian, Miner
2049'er & Tail of the Beta Lyre all in full flow with bucket loads of
very happy customers.

And for a bit of Silica shop trivia, for those that used the Tottenham
Crt Road branch, if you were served by a guy called Noel (an indian
looking guy with glasses) his full name was Noel Daniel and he wrote
Thunder Fox (Uridium clone) and co wrote Sidewinder (scramble type
shooter) for the 8bits.

Another member of staff called Erol (big black guy) wrote ST
commercial game software.

In the same branch was another guy who ran one of the biggest (if not
the biggest) UK pirate Amiga BBS.

Last thing I heard about Silica was that shed loads of stock was being
removed by the staff via the back door just before they folded.
There's still a computer shop in the Sidcup location.

Explore the island a bit more... After all, an island has to have at
least one town, right? And King Minos isn't going to live in some shack
somewhere... He's a king! Look for the kind of place a king would live,
keep my earlier clue in mind, and you should come across the entrance to
the labyrinth. BTW, a ball of string won't help you in the labyrinth,
but paying attenting and planning your course carefully will. Make sure
you're rested up and well equipped, too. The maze isn't empty and that
minotaur isn't going to give up his Labris without a helluva fight.

Yes you guys are... You guys need to get a freakin life man, This is pathetic. So what, a guy keeps posting the same ads on here. He is doing a service to all you pethetic Atari freaks who don't have a life... Maybe someone needs a part of something, what if someone NEW joins tomorrow? It would be nice if in a week Ben posts about his services and that person gets in touch with him about getting a part he needs... Not finding an ad 6 months old wondering if he still is in business to satisfy you anal idiots. There is no marketplace on here, maybe we should get a comp.sys.atari.marketplace or something! Would that be ok with you guys!??!?

Stop whining about it and try to turn off your Atari once in a while and get laid.

Don't get me wrong I do love the Atari, and some things annoy me too but this is just getting really old.

Leave the guy alone, if you do not want to read his posts ignore them. Resorting to wasted bandwidth, profanity and graphic texts about your "closet" fantasies it really getting old!

Damn sick of all this crap.
Tim

I'm with you, I didn't like it past five. Ultima IV was my favorite, since
I could play it on my 8-bit! I must have burned a thousand hours playing
that game.

# 3195. New eBay auctions - Atari XL/XE Monitor->SCART cable, DOS 1/3/4/XE Pack

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-04 11:22:29 UTC
From: dgs@clara.net
Message-ID: <3568e886.0306040322.7dc00092@posting.google.com>
Source record: 21208

Hello All,

I've recently started new eBay auctions for:

- Atari 800/XL/XE Monitor Port to SCART cable. Use your TV as a
monitor (as long as it has a SCART connector).

- Atari Unusual DOS Pack. 2 DS/SD disks containing Atari DOS 1,3,4,
and XE. Nice one for collectors or those wanting to see the 'missing'
DOS versions.

The link is below (this is likely to split on to two lines, so please
copy the whole link into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangarraghty

Hello Ian

Could you please describe your solution with a little
bit of more detail please?

I have a 800XL that has the same problem:
When I first turn it on, it boots OK.
Then load a disk game, play for hours, then
turn it off, then on again, and I get this black
screen. Turn it off and on again, and black screen again!

The only solution seems to power it off for more than
25 seconds and then turn it on.
But I think there's got to be an electronic solution to this issue.

Regards

Hi,

> The only solution seems to power it off for more than
> 25 seconds and then turn it on.
> But I think there's got to be an electronic solution to this issue.

This is not an electrical problem. The problem is rather that the RAMs
keep their contents for a while, and it takes 25 secs (in your case)
until the "magic cookies" the Os places in several RAM locations to drop.

Until then, the Os still detects their proper values, considers the power-on
a warmstart, but since other Os contents are damaged, just crashes then.

So long,
Thomas

Thanks, Cruiser7, I found him finally. I had played and finished the game once or thrice in the 1980's and only recently stumbled upon the Atari 8-bit emulator scene. I had been in the castle a half dozen times over the last few days, but only yesterdat noticed the open wall leading down from the bottom right corner. Didn't remember it until I took it.

Thanks for your help.

Greg

(replies to self.)
Uhm. There's a 1 meg simm upgrade by Bob Woolley
on the internet.
I'm suprised Mathy or Bo or Earnest or Andreas
hasn't replied about this.
The Claus Buchholz 256k upgrade I think is a homebrew
one and is compatilbe with either the Rambo or
Newell.
Bob Woolley says that basically there are two kinds
of A8 memory upgrades, ones that support Antic,
and ones that don't. Since you're looking to
view extended memory demos, I'd suspect you want
one of the Antic compatilbe ones.
Russg

(Me again.)
I found a description of the Claus Buchholz 256k
Antic compatible upgrade.
It is a copy of what was at Craig Lisowski's site,
I think, which originated someplace else.

You're very welcome. Back in the 1980's, I bought this nice new game
called Zork III and got stuck trying to move something. I turned to a
BBS for help and a fellow Atarian was kind enough to steer me in the
right direction without giving too much away. I figured the least I
could do was help another Atarian with a game that is a favorite of
mine. Have fun!

This is definitely the most common situation. In my situation, it would
come up to a black screen almost all the time, no matter how long I left the
power off for. In my situation, it was the power-on reset circuit that had
failed. More exactly, it was the electrolytic capacitor (a component that
often fails in older electronics, but usually in the power supply) that
provided the time constant for the power on reset pulse. I have a logic
injector, and was able to verify that it was a reset problem by injecting a
0v pulse to pin 40 of the 6502 processor, which dutifully reset, and the
machine came up every time. The capacitor in question is C49 - a 47uF
electrolytic capacitor. Available for under a quarter at most electronic
components suppliers.

You are right, I remember that specifically. You see, that's why I remember it. When I got it, sometime back in the 80's I think, I thought "Gee, this sucks... I don't think it will remain around this place for long". Thinking that, I threw it aside and forgot about it. As luck would have it, it remained around the place the longest. It appears every time I would check my shelf, or desk, or wherever I placed it last, it was still around. It was kind of funny actually. So, in turn it ended up being the most remembered as it stuck around for probably 15 years, when I had no other article left. I'm not sure what eventually happened to it, but I kind of miss laughing at having it around.

## 3209. Seven Cities of Gold

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-05 10:43:48 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <4ee3156c63527706632522e41ccf4c50@free.teranews.com>
Source record: 21222

Wasn't there a sort of mapping program that automatically brought about the entire map of the world you were exploring? Anybody have that little cheat?

Or did I just hack the map out of it, I suppose I could have done that too.

# 3210. Re: UK Atari owners - remember Silica Shop..?

Newsgroup: comp.sys.atari.8bit

Source record: 21223

I still have them!! Or to be more accurate, my parents are still
'looking after them' for me. When I bought one of the first atari
800xl's in the UK I was sent a 'video shop cover' with 6 cassetes in
them. (And yes, the programs were generally crap)

But it get's better. Many years later, I joined IBM and ended up
working with Richard Hawes. In case you don't remember he worked for
Silica shop and wrote many of the programs on the tapes.

Small world......

as far as i remember, there was a map editor for seven cities of gold.
it's possible that i have one, but i have to check it (while at home).

You're right-on, of course. The anon poster is obviously demented and in dire need of attention. He can't get it via his sub-Neanderthal personality, so he resorts to trolling in Usenet, in the hope that folks will pay attention to him at last. His true colors do shine through, however, in a number of ways. Consider his spelling and grammar atrocities - indicative of an early-high school dropout. I'd guess that he has a sever case of acne and wears ultra-thick glasses, his eyesight adverselt affected by extreme masturbation. And there is no doubt that mommy caught him yanking his crank more than once . . . perhaps even calling in the canasta group to witness her exasperated little boy sitting panting on the bathroom floor surrounded by muscle magazines. And consider his obsession with the gay life too . . . there's much more than meets the eye herein.

Some might pity the tyke, owing to the fact that his uncle/dad abuses him nightly, but I say to hell with him. The only reason to let him copntinue to breathe is for our amusement. Hence, consider him forthwith as your personal whipping boy. Scan each of his childish posts and use them to illustrate to others how a simpleton's intellect proved to be a total waste of sperm.

try searching bill's xlsearch (the old one) at:

http://www.newbreedsoftware.com/xlsearch/

for keyword cities - i think that the files cities_m you'll find
is the map editor in fact. if not, then i probably got mine from
some other place which i don't remember now. ;))

# 3218. XEP80 Tech Data?

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-06 04:14:23 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030606001423.23654.00000136@mb-m27.aol.com>
Source record: 21231

I finally have an XEP80 (XEP) working with my LCD monitor using an XGA up-convertor. I can get all 80 columns in a beautiful display, but only 23 and a fraction lines. So overscan is still an issue (to me). I am also coming to the conclusion that it is going to be impossible to find any LCD monitor that has a vertical size adjustment (which should allow compensating for the too-large display.) Horizontal size controls are common, but not vertical. I am also puzzled by the fact that Atari went to fairly significant lengths to make sure that overscan was not an issue with the normal (40-column) display, but apparently ignored this with the XEP. (?)

So the alternative might be to work on the XEP. Is anyone aware of any tech data for the XEP? I have the regular docs from Atari, but no significant hardware info. I also have read the two ABBUC articles, but these don't really go into the type of info that I need. The bottom line, I guess, is -- if there is any practical way to compress the display of the XEP (fewer scan lines, higher frequency, etc.)

Thanks,
Larry

## 3220. CP/M on Atari?

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-06 05:25:33 UTC
From: misterbumpy73@wmconnect.com
Message-ID: <20030606012533.20722.00000052@mb-m22.wmconnect.com>
Source record: 21233

I am about to run a Google search on the subject but thought I get a few takes from you people out there...

Was there ever a CP/M kit for the Atari like the one on the C=64? Like maybe a cartridge with a Z80 in it or something?

Thanks in advance!

Lou

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. I can afford to sell for less because I keep overhead down, avoid making promises I cant keep and avoid offering services I cant follow up on! So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org Or http://BenSells.Atari.org or Call Ben@(503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business! http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

http://www.aracnet.com/~atari/free_cat.html FREE Atari Catalogs!
http://www.aracnet.com/~atari/shipping.htm How I can save you Money!
http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

# 3222. FREE Atari stuff! Spring Cleaning!

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-06 10:42:24 UTC
From: Bravo Sierra Computers <atari@aracnet.com>
Message-ID: <Pine.LNX.4.44.0306060337230.32686-100000@shell1.aracnet.com>
Source record: 21235
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,pdx.forsale

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

==Thanx==
===Ben===

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at

http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received
Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

I Understand one was projected, prototype built, and then the project
stopped when the traimels took over. I've seem plenty of stuff out there on
the prototype, i can't remeber any 3rd party items that made the market
though.
www.atari-history.com has details on the prototype.

You know the secret to winning Ultima IV as quickly as possible is to go completely dishonest at the start of the game.

Start as a mage (honesty attribute) and stock up on regents, giving only 1 gold each.

Then go to the british castle through the portals and take the gold till you are stocked up to the top.

Go south and buy a horse in Paws.

Go all the way east and buy some keys in the far eastern village, just east of (Minoc)?

Then go back to the british castle, go to the back of the castle to the secret door with the ladder going down to the entrance. Open it with the keys and go in. Then, immediate cast the eXit spell.

Take the balloon waiting for you outside to the Bucaneers Den Island, SE of the british castle, in the great sea.

Buy magic wands.

With all the spell power and the magic wands and armor you can buy with all the gold, you can now play the game as an honest avatar without worrying about dying, by the time you reach level eight and go through the other things, you'll be an avatar.

Ultima V was good too, although I couldn't play it until I finally got either an ST or an IBM computer. I haven't found too many shortcuts for Ultima V that was as good as the one I just mentioned in Ultima IV though. I suppose the carpet is the best of them all.

# 3226. Seven Cities of Gold - Map Extraction

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-06 12:05:41 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <fcc0ef8bd63bbad2c4c086061b519fb0@free.teranews.com>
Source record: 21239

Okay, let me put it this way then...

I am interested in creating a game similar to Seven Cities of Gold in IBM format and would like to extract the map for research purposes. Before I go about trying to research exactly how I am going to do this, from Atari to IBM, I would like whatever information anybody can offer on the subject, any suggestions and ideas and experiences.

Judging by the way the map is loaded when you enter your 'home' it appears to be in a format from top to bottom, left to right.

The ATR8000 was a disk interface with a Z80 processor, and it could
run CP/M using the Atari as a terminal. I've heard that Indus floppy
drives with a 64k memory upgrade could also run CP/M.

Hmm just mail with your real e-mail address and maybe better mail us your
real home address. Then we can come to get you....

But it seems brain-less people like anonymouse posters like you are afraid
to post this info...

## 3231. Atari 400/800/800xl scancodes

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-06 23:05:54 UTC
From: Stefano Priore <stefano.priore@inwind.it>
Message-ID: <pn6rbb.e12.ln@127.0.0.1>
Source record: 21244

Hi everybody!

I'm looking for a table that associates each keypress with its
corresponding scan code, i.e.

L 0x00
J 0x01
; 0x02

...
...
...

CTRL+SHIFT+G 0xfd
CTRL+SHIFT+S 0xfe
CTRL+SHIFT+A 0xff

As you might have understood, I already have such a table, but it's
partial and not official: is there a book/FAQ/manual that lists all 256
scancodes?

BTW does the table remain the same across all Atari's, from 400
to-whatever-it's-the-last-its-late-and-I-don't-remember? ;)))

Thanks!

Computes 3rd Book of Atari with the green cover contains the complete
character set data including atascii, internal codes and scan codes. They
are the same from the 400 to the 130XE with the possible exception of the
1200XL which had a couple extra keys for character set etc.

I do not remember any official Atari or APX publication that provided it
unless it is in the hardware manual...

haaa !!!

I LOVED Ultima III, IV was great (never played the V).

But, did you guys try the VII ? black gate&&Serpent ISle ?

The Black Gate is the best ultima i ever played... (I finished the VIII and
IX)

IX is really a good game if you feal nostalgic ;)

# 3242. Seven Cities of Gold - New Game Format

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-08 10:37:24 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <cdb0625dfb404e460b562d2866f3b8c4@free.teranews.com>
Source record: 21155

Got a question for you guys....

I'm interested in creating another game of the Seven Cities of Gold, yet in this version I was going to make it a goal to actually find the Seven Cities of Gold.

I was going to base some of it off of the cartoon series "The Mysteries Cities of Gold"..

Now, the question I need some help with, for those that have played the game... how, in your opinion, should the native villages be arranged...

In the original game, there are a few houses or pyramids and you just find the chief and trade (or go to war). What I was thinking was to create actual villages, each one different where you can walk around and explore. Furthermore, you can talk to more than just the chief. I was thinking about a transaction simulation similar to Ultima IV, where certain natives can provide clues to the cities of gold.

If I provide a one on one transaction like this though, I am hard stuck for a way to create a battle simulation in which you would fight the natives... your men against the native men. I need some ideas.

Also, I am weakly considering the introduction of cannons, muskets, and horses in the battle simulation but am not sure how I should allow that to effect things like traveling across the continent, how to incorporate it in the battle simulation without making up a whole new strategy plan...

I need some ideas here, and many of you have experience in these games and can probably give me an idea as to what would work for you.

Let me know, thanks..

>Let me know, thanks..

I kind of like the idea of actually finding the seven cities of gold. I loved playing the original game. It was fun. The big thing for me, in this new version of yours, is what do you do when you actually find each city. You could have the game start out like the old one, but then the game would give you a clue as to where the first city of gold is. Then when you find that city, you must search it or ask acround to find clues that lead you to the next city and so on until you find all of them. Finding the next city might involve going to other cities or places to find other needed clues. If this sounds like an Ultima game, you got it. The Ultima series was the best game series I played on the Atari computer. When all the cities are found, you would then go back home to announce what you have accomplished. Sounds like it would make a good game.

Larry,

About the only good source of technical info for the XEP-80 is found in
National Semiconductor databooks on the chip that they used. I forget
what the chip number is but I do know it's a Terminal Managment Processor.

This chip is the heart of the XEP-80 and the databook may help you if you're
willing to do the research. I've haven't seen any schematics or firmware
source
code.

Good luck.

Glenn

Yes it is an internal upgrade....what do you want a picture of? the box
with the sticker, or the internals of the 600XL????

## 3247. XEGS monitor output?

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-08 20:11:09 UTC
From: RC <rc@rc.com>
Message-ID: <WKMEa.681$0c4.94381@news20.bellglobal.com>
Source record: 21160

Does the XEGS have the same monitor output that is included with the 800XL?
Does the 65XE and 130XE both have monitor (composite) output?

# 3248. Re: XEGS monitor output?

Newsgroup: comp.sys.atari.8bit

"RC" <rc@rc.com> wrote

> Does the XEGS have the same monitor output that is included with the 800XL?

No.

> Does the 65XE and 130XE both have monitor (composite) output?

Yes.

As for the XEGS, it has two cinch (RCA) connectors, one for audio, one for composite video.

Computes 3rd Book of Atari with the green cover contains the complete
character set data including atascii, internal codes and scan codes. They
are the same from the 400 to the 130XE with the possible exception of the
1200XL which had a couple extra keys for character set etc.

I do not remember any official Atari or APX publication that provided it
unless it is in the hardware manual...

You can get a full listing yourself by using BASIC to print the value stored at address 764. Remember to store 255 into address 764 after reading it.

The 5-line BASIC program from Mapping the Atari, COMPUTE! Books, 1985, does this in a loop, which I condense into 2 lines:

```
10 A=PEEK(764):IF A<>255 THEN ? A:POKE 764,255
20 GOTO 10
```

Press the BREAK key to end the program. I made one such keyboard map for the Atari 800 years ago for all possible shift-control-key combinations. It doesn't take much to to make, even in a keyboard layout rather than a table.

Kudos to Richard Anderson for all the good help and instruction. With
his help, I found a bad 7406 chip and replaced it. Works great.

Thanks to all.

Cross-posted to: alt.folklore.computers,comp.sys.atari.8bit,comp.sys.cpm,comp.sys.apple2,comp.sys.msx,comp.sys.sinclair,comp.sys.tandy,comp.sys.ti,

The Best of Creative Computing Volume 2 is now available on the Web in its entirety. Published in 1977, this book is a true classic, containing 300+ pages of articles and programs published in 1976, the second year of Creative Computing magazine.

http://www.atariarchives.org/bcc2/

A few highlights, in no particular order:

Building a MITS Altair 8800
http://www.atariarchives.org/bcc2/showpage.php?page=272

Account of 1976 Star Trek Convention
http://www.atariarchives.org/bcc2/showpage.php?page=162

Videodisc Systems
http://www.atariarchives.org/bcc2/showpage.php?page=9

XEROX PARC Flight Simulator
http://www.atariarchives.org/bcc2/showpage.php?page=37

A Retail Computer Store? You Gotta Be Kidding!!
http://www.atariarchives.org/bcc2/showpage.php?page=91

Computer Literacy Quiz
http://www.atariarchives.org/bcc2/showpage.php?page=62

Atariarchives.org also features the Best of Creative Computing volume 1
http://www.atariarchives.org/bcc1/
...as well as 13 other classic computing books.

Enjoy,
Kevin Savetz

The one thing this DOESN'T show is that CTRL + SH + A has a scancode of 255.

10 POKE 764,0
20 A=PEEK(764):IF A=255 THEN ? "YOU PRESSED CTRL+SH+A!":GOTO 10
30 GOTO 20

;^)

------------------------------

Subject: Introduction
```

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

SAE/SASE/IRC info from http://www.genfair.com/greenpages/sae.htm
---------------------------------------------------------------
It is courteous when writing to any new correspondent to cover in advance their postage costs in replying to you. If they are in the same country it's a simple matter to enclose an SAE (stamped addressed envelope), which is known in American English as an SASE (self-addressed stamped envelope). It is not always obvious how to do this for correspondents in another country. One answer is to use International Reply Coupons.

An International Reply Coupon can be purchased at any Post Office in any country in the world. This is agreed through the Universal Postal Union. You can then send the IRC to someone in another country who can cash it in at a Post Office there for a postage stamp covering the minimum rate for an Airmail letter (unregistered).

One IRC enables a letter up to 10 grammes to be airmailed abroad. That's not much more than a couple of sheets of paper. So if you want a reply with more than this, better send two or more IRCs!

Verfications -> YOU!
--------------------
This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this

list, please do your part in keeping it useful for everyone!

---

Archive-name: atari-8-bit/welcome
Posting-Frequency: 7 days
Last-modified: February 26, 2003

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> code.

In case you've scanned version of the databook, would you be willing to
mail it electronically? I would be interested in a XEP-80 emulation, but
lack *any* documentation about it whatsoever.

Thanks,
Thomas

Thanks, but I don't have a real machine to test your program with, and I
don't know how faithfully actual emulators deal with the issue. If you
can point me towards a correct emulator... (or at least, tell me the
first 64 entries of the table, since bit 6 and 7 are used to encode
Shift, CTRL and Shift+CTRL tables ;)))

Anyway, thanks for the help: In the worst case, I'll wait until Kevin Savetz posts
Compute's 3rd book of Atari on www.atariarchives.org!

# 3264. Atari bits and pieces available

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-09 21:07:46 UTC
From: sandyprice@msn.com
Message-ID: <be7373cf.0306091307.7307424d@posting.google.com>
Source record: 21177

Hello:

I recently discovered that I still have a couple of Atari parts for which I have no use.

1) A VersaWriter digitizing table, conplete with original VersaWare software 5-1/4 floppy disk for Atari, plus an original Atari Demo disk for same, and a "copy" of the VersaWriter software with VersaWriter Graphics Table program on the back side of the copy disk. The VersaWriter software is called Graphics Composer. Also a "Picture Storage" floppy. In addition, an Apple Demo Disk of the same VersaWriter. It is still in the original box in which it was received from Versa Computing, Inc.

Since I don't have any of the Atari computers I once owned, I cannot vouch for the "operability" of either the hardware or the software.

2) One MPI model 51M hard drive, without case, still sealed in it's bubble wrap shipping. Manufacture date of July, 1981. It was purchased back when some of the Atari stuff was getting hard to find for the old 800 series. Just in case one of my drives died, which none of them did.

I hate to take this stuff to the dump if someone out there can use it. If there is a market for it, please let me know.

Thanks,

Mike Price

look at :

http://cgi6.ebay.com/ws/eBayISAPI.dll?ViewSellersOtherItems&include=0&userid=klassische-videospiele&sort=3&rows=25&since=-1&rd=1

There are lots of boxed ATARI 2600 and ATARI XE cartridges , for
example :

Thunderfox
Rescue on Fractalus
Airball
Lode Runner
Star Raiders 2
Archon
Crime Buster

and more.

All auctions are "Buy it now" , all games boxed/new/shrinkwrapped.

# 3269. Atari 8-bit computers and software fo sale--Harrisburg, PA

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-10 00:54:09 UTC
From: Mike Schnierle <mike.schnierle@comcast.net>
Message-ID: <ptWcnbAEY8lKt3ijXTWcqQ@comcast.com>
Source record: 21182

I live in the Harrisburg, PA area. I have two Atari computers (a 400 with 48k of ram and a home built full-stroke keyboard, and a 130XE), as well as a disk drive, trackball, paddles and multiple joysticks, and much software, both games and stuff like Atraiwriter, Synfile, etc. , and manuals and books galore. I want to sell this stuff, but frankly don't want to bother with either Ebay or shipping. If there is anyone in the Harrisburg area who might be interested in any of this stuff, I'd be glad to let you look through it and make a deal for whatever you might want. Respond by email please. The 400 has been packed away for some time, but was operational when it was stored. The 130 and drive have been operated in the last couple of years (used to make video titles, and for the occasional game).

Mike Schnierle

mike.schnierle@comcast.net.

## 3270. CP/M on Atari?

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-10 01:35:01 UTC
From: Roy G Biv <8-bitter@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.53.0306092101120.5257@shell1>
Source record: 21183

On 06 Jun 2003 at 05:25:33 GMT, Mister Bumpy73 scribbled:
->>Was there ever a CP/M kit for the Atari like the one on the C=64?

To which on Fri, 6 Jun 2003 at 12:27:13 -0400, Bill Marcum re-
plied:
->The ATR8000 was a disk interface with a Z80 processor, and it
->could run CP/M using the Atari as a terminal. I've heard that
->Indus floppy drives with a 64k memory upgrade could also run CP/M.

You heard right! In 1986 Future Systems, successor to the orig-
inal Indus Company, marketed a 64K memory board for insertion into
the expansion space of the Indus drive. With their accompanying
CP/M O.S. disks, the Indus functioned as a Z80 computer, and the
Atari became merely a terminal. Incidentally, the CP/M system
worked, but the Indus had to be kept very cold to prevent it from
overheating!

# 3271. [ANNC] Golgatha II : Demon World

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-10 02:05:39 UTC
From: ppanks@juno.com
Message-ID: <cb0ed86a.0306091805.5b358768@posting.google.com>
Source record: 21184
Cross-posted to: comp.sys.ibm.pc.games.rpg,comp.sys.ibm.pc.games.action,comp.sys.cbm,comp.sys.atari.8bit

Hello,

"Golgatha II : Demon World" has just been released. A 2-D RPG maze adventure game, "Golgatha II" improved on the previously released "Golgatha : The X-Chronicles" in many areas. Both games are based loosely on an old Commodore 64 game called "Box Mania II".

Improved graphics, gameplay, additional levels and increased speed compliment this new release.

For more information, please visit:

http://www.geocities.com/dunric/westfront.html

(scroll down to "Golgatha II" to download the game)

A Commodore 64/128 and Atari 400/800 version of Golgatha is currently being planned as time permits.

Sincerely,

Paul Panks
dunric@yahoo.com

One solution could be:

5 OPEN #1,4,0,"K:"
10 FOR A=0 TO 63
20 PRINT "SCANCODE ";A;" = ";
30 POKE 764,A
40 GET #1,N
50 PRINT CHR$(N)
60 NEXT A

That'll 'feed' keys in, and read them from the K: device. ;)

> can point me towards a correct emulator...

www.math.tu-berlin.de/~thor/atari++

Look into "keyboard.cpp", it contains a table that gives scan-codes by
ASCII (not ATASCII!), and translation functions for non-ASCII "special"
keys like the Atari/InverseVideo and CAPS key.

Source: Experiments and "Das Atari Profibuch", Sybex Verlag (unfortunately
german, but the table is international. (-; )

> (or at least, tell me the
> first 64 entries of the table, since bit 6 and 7 are used to encode
> Shift, CTRL and Shift+CTRL tables ;)))

In principle, yes, though not all Shift+Ctrl combinations work.

So long,
Thomas

I would do the 512K static RAM upgrade, myself. The static RAM is
bulletproof and I have found very little use for more than 512K of memory.

Hi..

I've studied the B.W. 1M upgrade (the hand drawn schematic one). it's very rough; lots of contradictions between the scheamatic and text (text mentions 2xHC157's, schematic has 1x157, 1x158?), an apparently incomplete schematic (what pin the -map signal of the HC157? [hint: it's pin 7]), no clear explination of how/where to fit it to the machine for models other than 1200xl. I wonder if anyone else has ever built one successfully, too. The design seems to fail to explain how conflicts between the atari's main RAM and the simm are adressed (no sign of how the onboard RAM is disabled during SIMM access??) or indeed wether one is supposed to remove the onbard RAM entirely.

FYI, there's a heap better design available at http://www.atari.sk/satantronic/ which I have studied the circuit for in detail, and can positively say it's a far better design, if for no other reason than it's overall clarity. I am in the process of building that one right now....

# 3286. Newbie: Faulty 600XL

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-11 16:01:23 UTC
From: realbacon@hotmail.com
Message-ID: <e22cbe5c.0306110801.30f9a162@posting.google.com>
Source record: 21099

Hi all,

I'm mainly a Commodore user (hiss! Booo!) but I'm a fan of all 8-bit micros. Recently I got my hands on an Atari 600XL with tape drive and original Atari joystick for only SEK50 (~USD4). I tried to connect it to my Commodore 1084S monitor using the same cable I use for my Commies which should work AFAIK.

The problem is that I only get a blank screen with red background and black border (IIRC, I don't have it in front of me right now). Not being familiar with the Atari's architecture, I'm unable to guess what the fault is (bad video chip? Bad character generator ROM? Bad RAM?).

If some friendly soul can help me out, if only with a helpful link, I'd appreciate it very much.

I'm not afraid of doing open heart surgery on the machine and I am able to burn EPROMs if necessary.

Thanks,
Niklas Ramsberg,

AFAIK, it might not. IIRC, the video out was somewhat different, though
I fail to remember the details (something like chroma/luma was separate
on one of the two systems, though I don't recall on which).

Thus, your fault might not have to mean anything.

> The problem is that I only get a blank screen with red background and

Press Control-2. Do you hear any sound? (This is the buzzer, should
sound like "Brrrreeeeppp"). If you turn it off, hold the Option key on the
right hand side, keep it pressed and turn it on again while holding the
key, do you see any other "patterns" on the screen? This should start the
self-test of the unit, allowing you to see what's wrong with it.

> I'm not afraid of doing open heart surgery on the machine and I am
> able to burn EPROMs if necessary.

Well, first things first. If it's just a wrong video connector, then the
buzzer will work, and the selftest should at least generate an image that
looks different from the first. If this does not work, then something else
is broken. Defective RAMs or ROMs are 'typically' found with the selftest,
unless too much is broken here. If one of the custom chips is defunct, an
EPROM burner won't help much either, I afraid...

Greetings,
Thomas

As far as I know, the 600XL doesn't have a monitor output, it just only has an RF out. So, did you try to connect it into a TV?

Tried the RF output to a TV too. Same thing there, but _much_ worse
picture (my widescreen TV doesn't seem to like any of my old
computers' RF out). I think the
Atari machines have the same monitor out as the VIC20 and early C64.
At least they use the same 5-pin DIN connector. And I do get a stable
picture with my cable, although it's all red (or perhaps orange) with
a black border at the top and bottom.

No sound. No self-test.

> unless too much is broken here. If one of the custom chips is defunct, an
> EPROM burner won't help much either, I afraid...

I figured that much out myself ;-)

Anyway, I thought I'd have a look inside the machine to see if I could
perform some of the standard tricks to get old computers in working
order (i.e. reseating socketed chips, etc). I loosened the three
screws holding the PCB to the shell, but I couldn't get the board out
of it. The end where the joystick ports are situated came loose
without a problem, but it was still stuck at the other end. Is there
some trick to get it out of there?

Wilheim: My 600XL does have a monitor out as already stated. I saw
something about this in an earlier post on this newsgroup. Apparently
American 600XLs don't have a monitor out, while European ones do.

The faq has the pinouts. I suspect the C= and
Atari actually don't use the same pins.
From the FAQ: (looking at the port or the plug?, I guess the port.)
1. Composite Luminance
2. Ground
3. audio
4. Composite combined lumina and chroma (probably use this one.)
5. Comp. Chroma (not on 800xl, 1200xl or 600xl european).
3 1
5 4

K-Razy Shootout was a very fun Berserk clone for the 8bit, but I don't recall that Berzerk itself was ever ported. There was a pretty good Berzerk for the 2600, yes.

IMO, a proper Berzerk clone should have convincing voice effects, but none of them did IIRC.

Yes, it was produced for the 400/800 in 1983 by Atari.

# 3294. Classic Gaming Expo: Why you NEED to go!

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-12 14:53:25 UTC

Hi gang,
I was drafting some promotional material for various media requests and thought I'd share this here as well. You can get the updates at http://www.cgexpo.com or visit the CGE Forum at http://www.digitpress.com/forum/viewforum.php?f=7 for more information. As always, feel free to email me at digitalpress@email.com if you have any questions.

See you in August!

* This year is prime to be the biggest and best ever, sponsored and supported by Digital Eclipse, Intellivision Productions, Telegames USA, Tips & Tricks magazine, and Twin Galaxies.

* Meet the Legends of video gaming! Dozens of video gaming's "alumni" will be present. In recent years the show has featured the likes of Ralph Baer (the "father of home video games"), Al Alcorn (the creator of Pong), Don Bluth (former Disney artist who crafted Dragon's Lair and Space Ace), David Crane (Pitfall!, Dragster), Katz, Kunkel and Worley (Electronic Games, Sega Visions), Jay Smith (designer of the Vectrex), and many more. This year's attendees can be found on the CGE site and will be updated regularly.

* These greats will be speaking at a series of keynotes that extend from the beginning of the day on Saturday through the end of the day Sunday, and will also be on hand to meet and greet attendees and sign autographs. Bring your games!

* The CGE Museum featuers over 500 items including many one-of-a-kind items. The museum contents change with each year so you're always guaranteed to see something new that's probably quite old - and rare!

* The CGE Classic Arcade features over 50 coin-op machines set to free play. Revisit the games of yesteryear and see why there's no era like the classic era.

* Classic game consoles are set up along the ballroom interior. Bring back some memories of your Atari 2600, Vectrex, or Nintendo NES.

* Live musical entertainment, featuring some very talented artists who bring classic game themes to life, including 8-Bit Weapon, FirestARTer, and the C-Men.

* Prizes and tournaments at every turn, including several sponsored by Twin Galaxies and JagFest.

* Each year, new games are debuted and released. This information is typically saved until very close to the show, so check the CGE site for updates. Already announced: CGE Services' "Entity" for Atari 2600 and Good Deal Games' "ColecoVision 14-in-1 Pack". More to follow!

* A live auction is held on Saturday night after the show, where many rare and one-of-a-kind items are put on the block. You could end up getting the deal of a lifetime!

* Participate in Saturday's "Swap Meet", an hour session bringing collectors and retro gamers together for some wheelin' and dealin'!

* G4 TV and Retrogaming Radio will be broadcasting live from the show.

* Dozens of exhibitors with classic gaming ware will be on hand, including Atari2600.com, B&C Computervisions, Digital Press, Good Deal Games, HanaHo, Intellivision Productions, The Lost Levels, NWCGE, Oldergames.com, Packrat Games, Songbird Productions, Telegames USA, Twin Galaxies, and Vintagegamer.net.

* Don't miss special events hosted by our show's exhibitors, like Digital Press' annual Classic Video Game Jeopardy or this years' Nintendo World Championship redux tournament hosted by The Lost Levels. Fun, games, and prizes around every corner.

WHEW.

www.math.tu-berlin.de/~thor/atari++

Look into "keyboard.cpp", it contains a table that gives scan-codes by
ASCII (not ATASCII!), and translation functions for non-ASCII "special"
keys like the Atari/InverseVideo and CAPS key.

Source: Experiments and "Das Atari Profibuch", Sybex Verlag (unfortunately
german, but the table is international. (-; )

> (or at least, tell me the
> first 64 entries of the table, since bit 6 and 7 are used to encode
> Shift, CTRL and Shift+CTRL tables ;)))

In principle, yes, though not all Shift+Ctrl combinations work.

So long,
Thomas

>>

OK, here we go. I found my chart. By the way, Shift-Control-A is 255. My
chart has all the keys on the keyboard, then all the shift combinations. But,
I simply give the code for the normal key. Add 64 to get the Shift- scan code.
Add 128 to get the Control- scan code. Add 192 to get the Shift-Control- scan
code.

Key Scan Code

Hi,

> OK, here we go. I found my chart. By the way, Shift-Control-A is 255.

Well, in some wierd sense, yes, though note that the Os uses 255 for
"no key pressed" as well. Thus, you won't be able to find anything useful
in the keycode shadow register for that value. Besides, there have been
some keyboard keys that did not work with Shift and Ctrl together, even
though they should have.

Greetings,
Thomas

Yes, there was a version for the 400/800 which I have. Nice
graphics and sound effects.....

I have a great version of Breakout for the 8-bit computer line. It
had the voices and was a very good arcade translation for the time.
All IMHO of course.

Berzerk was released for the Atari computers in 1983 as a 16K cartridge.

The thing talked. It even taunted the player sometimes :)

Hi all.

Getaway! by Mark Reid, (c)1982.

Let it be known that I love this game and have spent many many hours playing it.

If there is anyone else out there who likes it, listen up.

Inspired by a magazine ad I remember seeing for the game many many many years ago (well, like 20), I have whipped up an image comprising the entire game map. I have also created a desktop wallpaper image, if you are so inclined. It's funny how this entire map (which seems quite huge when playing) can be viewed without any scaling on a modern monitor.

Anyway, for lack of a better distribution method, they're on my FTP, which will probably be left up for only a few days, so get it while it's up (it's not up on a regular basis). Address: phozz.mine.nu , standard port, anonymous login. Prefixing with ftp:// will work in any browser.

Also, I've played around with a disassembler and came up with a couple of cheats.

Use Atari800WinPlus. Load up the game and enter the monitor with F8. (To exit the monitor type CONT.)

These cheats are incremental, it's best to do them in order and leave the previous ones intact.

Cops can't catch you:
```
a 2db3
lda #0
```

Cops *pay* you:
```
a 2cf6
nop
nop
```

Diamonds are forever (*):
```
a 2dde
nop
nop
nop
```

(*) This last one is pretty surreal. After enabling it, restart a game and go get the white car. Enjoy :)

-Itay

I've just updated 5 of my Atari Catalogs covering Games/Software, Books/
References and Hardware/Accessories for Classic Atari 8 Bit and Atari ST
Computer Lines! I've sold some and added some like DooM for the Jaguar!
http://www.aracnet.com/~atari/free_cat.html FREE Atari Catalogs!

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari
Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari
Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods!
So not only do I sell NEW Atari Goods at a competitive price, I also sell
used Atari Goods you may not be able to find anymore at Swap Meets, Thrift
Stores or even Auctions Sites! And I sell for less! And unlike those who
will remain anonymous! I test Goods before I sell them. I can afford to
sell for less because I keep overhead down, avoid making promises I cant
keep and avoid offering services I cant follow up on! So not only can I
sell you some Great New stuff! But I can sell you hard to find 2nd Hand
Goods, partly because I'm the guy most people come to when they want to
give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion!
Act Now,or I can't save you any Money! Goto http://BensCatalogs.Atari.org
Or http://BenSells.Atari.org or Call Ben@(503)256-9974! I'm not asking a
lot, I'm just trying to make a living and I'd like to earn your Business!
http://www.aracnet.com/~atari/numbers.htm Calling Hours and Info:

http://www.aracnet.com/~atari/shipping.htm How I can save you Money!
http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

I've got a fast turnaround rate. Usually, Once I receive payment your
order goes out the same day. Customers love the speedy service! I have
lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or
Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/
Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at

I still have a lot of FREE Atari stuff left. Looking for someone to come pick it up here in Portland, Oregon USA! E-Mail and call (503)256-9974. I'm not interested in shipping this stuff, so come pick it up.

I want someone to come and pick this all up! So Call first for appoinment! Then drive to Portland, Oregon USA and you too can stuff your Van, Truck or Volkswagon Beetle with my old Atari stuff. It needs to go and move into your home! I'm spring cleaning and making room for more Inventory. If you cant come get it, someone else will! DONT ASK me to ship any of this to you, I DONT HAVE time and it's too much work! You would have to Bribe me with SeriouS CA$H! And please, no trade offers! I'm trying to get rid of stuff! Most of All, I'm not going to Ship any of this to other Countries, like outside the U.S.A. So please, DONT ASK! I'm not trying to be rude, it's just that dealing with Shipping stuff I'm giving away for free is too much work for not enough money! So, are you Interested? E-Mail Atari@aracnet.com and call Ben at (503)256-9974.

I've got some stuff to get rid of. Time for Spring Cleaning. Commodore 1084S Monitor made by Phillips---Parts/Project only. Atari 810 Disk Drives and Atari 600xls' Computers, Parts Only! Surplus Atari 800 Computers.Atari 410 Program Recorder---Parts machine. Miscellaneous Brands 8 Bit Atari Compatible Disk Drives, as-is. Atari & Non-Atari Joysticks for parts! 1030 MoDeM in the Box.

I have Atari 520ST, 1040STF Computers mainly for parts. Nameless VGA Monitor. Nameless Multi-Sync Monitor, as-is. Various Cases and KeyBoards for 520ST, 520STFM and 1040STF. Various ST Mice Parts. Various Electronic odds and ends as well as some Tools and accessories for Electronic Repair! Please don't expect details or description on electronics and/or tools as I'm not a Technician trained. Canon IX-12F FlatBed Scanner, Project/Parts, made to work with Navarone Cartridge interface as Scanner for MiGraph's OCR and Touch Up Software. As well as Straight FAX Software. Atari ST Monitors, several rare Atari PC 14" Monitors used on the Atari PC, TT030 as a Color Monitor, also used for Atari Falcon 030 Computers as well as a standard VGA Monitor on a PC. As-Is. Due to the rarity of these monitors, I will sell and Ship them within the United States! For Collectors like Atari Museums and Private Collectors!Only Serious Buyers need make offer! Various old/surplus MoDeMs and Printers. Atari SF354 & SF314 Disk Drives, as-is as well as parts/incomplete SF354/SF314 Disk Drives.

# 3308. Re: 800XL memory upgrade

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-13 04:13:08 UTC
From: Bob Woolley <ataribobdelete@alamedanet.net>
Message-ID: <3ee94fb1$0$27417@fountain.mindlink.net>
Source record: 21121

The main memory is supposed to be removed - this is a total of 1024K, not 1088. Yes, -MAP is pin 7. I have a little note on my "schematic" that says A10 goes to pin 19 of the SIMM. I am not even sure what that means at this point.

This hack is not for the casual user. It is a demonstration of what logic is required to support a 1 meg (or larger) upgrade using 30 pin SIMMs. The circuit does work as shown on a 1200XL. It refreshes properly and maps 1 meg of RAM into an Atari. As I said, the SRAM is way much better.

From: brianw@udel.edu
Message-ID: <288e676d.0306130525.7277c1f9@posting.google.com>
Source record: 21125

I used to have an atari 800 and 1200XL and a tape reader. I had a game who's name I can't even remember but have been trying to find at least a box shot or an instruction manual for. The theme was that your space ship had crash landed on a jungle planet and you were trying to cross the planet surface and return to a safe research station on the other side. you got to choose what weapons you started with and had to fight some dinosaurs and stuff. the only screen i remember was the map which looked like a hexmap and had terrain marks for trees rivers and things. It was basically a turn-based strat where you would move to a terrain and fight whatever was there. You had to make it across the surface in a certain amount of time. I think the box had a purple cover. If anyone here has ANY idea what I'm talking about, I'd love to hear from ya.

Hi there,
I've got my xf25 running. (blue screen with the "ready" sign)
basic works fine (tried 3 lines of code plus "run" and it worked)
downloaded some games with com extention and some with atr.
How do I play with them??? nothing seems to work
"XF25 DOS25.XFD game.atr" nor "load game.atr" command would get me started.
Can someone help me please?
Thanks in advance,
Avi

# 3314. Re: Need help: can't get started with my 800XL emulator

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-13 17:14:06 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <yDnGa.47111$lo.4360594@newsread2.prod.itd.earthlink.net>
Source record: 21127

Assuming XF25 is XFormer, then the command line:
"XF25 DOS25.XFD game.atr" should start XFormer with the .XFD image in drive one and the .ATR in drive two (does ver 2.5 accept .ATRs?) AND Basic enabled which may interfere with many applications. You might need to use the disable switch ( -N in ver 3.8) to free the memory taken by the language cart. The next step depends on the content of the image files.

For Basic applications or games, use:
LOAD "D2:SOMEGAME.BAS" and then RUN or
RUN "D1:SOMEAPPL.BAS" at the Ready prompt.

If they are executables, then at the Ready (if Basic enabled):
DOS <Return> for the Dos 2.5 DUP.SYS menu
A <Return>
D2: <Return> provides a file listing of drive two image and
L <Return>
SOMEGAME.EXE <Return> loads and runs it.

Many games load in the same memory space as DOS and will not run from the DOS Menu; either rename it to AUTORUN.SYS and reboot with the image in drive one or get a game loader mini DOS to boot in drive one.

> >I guess I am ohne of the lucky ones, as I live in Central London, about 30 minutes walk from silica's old tcr store

I still remember when they were still based litterally next door to what used to be barclay's bank in tcr ..circa 1983/4 (now a public house-pub)(tottenham court road) they had a back end of what was a consumer electronics shop, they even advertised up the 5200 which if memory serves me rightly never made it into the EU mkts, that's were I knew noel daniels from, I've known him ever since ( as he used to live and the s/w company he designed sidewinder for was located in grays inn road, just down the road and around the corner from me) incidently Paul Carr who designed some of the sonix for thunderfox and Sidewinder and worked for and helped in the coding also designed the front end for John Lawsons (computer support)Ultimon, basically a UK ripoff/clone of the US Omnimon

I did frequently take trips to silica virtually every week when they'd moved to lion house proper, I did go and shop with silica when they'd moved accross the road, but by then things were beginning to tail off atari wize circa 1993(when I got my first job-) and apart from the very crappy virgin games centres (very pro commydore/speccy... even pilot software (just opposite and down the road fromn silica) had more atari 8bit support then virgin (which says a lot for a shop that didn't advertise it's atari support)
most of my software I ever bought was from silica, including mac 65 (cart) @ 70 pounds, atari assembler @ 16.99, i also used to take the train from charring x to go to their sidcup branch, which was a half decent shop, the best thing I also remember about silica was that unlike the staff you saw in other computer shops, at least the people who worked for silica (especially in London) knew what they were selling, it was almost as if it was an atari shop run by atari users for atari users
